The Health Consequences of Smoking—50 Years of Progress

Supplemental Evidence Tables

Chapter 6.	Cancer	S-3
Table 6.3S	Case-control studies on smoking and primary liver cancer	S-3
Table 6.4S	Cohort studies on smoking and primary liver cancer	S-12
Table 6.5S	Prospective studies of cigarette smoking and colorectal cancer incidence, published 2002–2009	S-21
Table 6.6S	Case-control studies of cigarette smoking and colorectal cancer incidence, published 2001–2008	S-26
Table 6.7S	Prospective studies of cigarette smoking and colorectal cancer mortality, published 2002–2009	S-28
Table 6.8S	Prospective cohort studies on the association between cigarette smoking and prostate cancer incidence and mortality	S-30
Table 6.9S	Epidemiologic cross-sectional studies on the association between cigarette smoking and stage and histologic grade at diagnosis of prostate cancer	S-45
Table 6.10S	Cohort studies on the association between cigarette smoking and risk of prostate cancer progression, case fatality, and all-cause mortality in men with prostate cancer	S-48
Table 6.11S	Reports on levels of endogenous hormones and smoking in premenopausal women (n = 22)	S-52
Table 6.12S	Reports on levels of endogenous hormones and smoking in postmenopausal women (n = 17)	S-57
Table 6.14S	Cohort study reports of the association between active cigarette smoking and risk of breast cancer, based on studies published before 2012 (n = 15)	S-60
Table 6.15S	Case-control study reports of the association between active cigarette smoking and risk for breast cancer, based on studies published from 2000 to 2011 (n = 34)	S-75
Table 6.16S	Evaluation of reports on exposure to active cigarette smoking for meta-analyses, based on cohort studies before 2012 and case-control studies published between 2000 and 2011 for meta-analyses, by location, study design, size of analytic sample, type of referent group, meta-analysis categories, and design or analysis issues (n = 65)	S-109
Table 6.17S	Summary of meta-analyses for measures of active cigarette smoking for all studies combined and stratified by study design, based on cohort studies published before 2012 and case-control studies published from 2000 to 2011	S-118
Table 6.18S	Reports of premenopausal and postmenopausal relative risks (RRs) by study and meta-analysis RRs for the association of active smoking (ever, pack-years) with risk for breast cancer, based on cohort studies published before 2012 and case-control studies published from 2000 to 2011 (n = 20)	S-120
Table 6.19S	Reports of estrogen receptor status relative risks (RRs) for the association of active cigarette smoking (ever, cigarettes/day) with risk for breast cancer, based on cohort studies published before 2012 and case-control studies published from 2000 to 2011 (n = 17)	S-123
Table 6.20S	Reports on the association between active cigarette smoking and risk of a second primary contralateral breast cancer (n = 7)	S-125
Table 6.21S	Modification of risk for breast cancer associated with smoking by <i>NAT2</i> phenotype, based on two meta-analyses and one pooled analysis, stratified by menopausal status	S-126

Table 6.22S	Reports on cohort studies of the association between exposure to secondhand smoke and relative risk (RR) for breast cancer incidence, based on studies published before 2012 included in the 2006 Surgeon General's report (n = 7) S-127
Table 6.23S	Reports on case-control studies of the association between exposure to secondhand smoke and relative risk (RR) for breast cancer incidence, based on studies published before 2012 but not included in the 2006 Surgeon General's report (n = 11) S-132
Table 6.24S	Evaluation of reports on exposure to secondhand smoke among 171 nonsmokers, based on 10 cohort and 24 case-control studies of breast cancer published before 2012 for meta-analyses, by location, study design, analytic sample size, meta-analysis categories, and design or analysis issues (n = 39) S-142
Table 6.25S	Summary of meta-analyses for the broadest categories of exposure to secondhand smoke (adult—any source, ever in lifetime, most comprehensive) for all studies of breast cancer combined and stratified by menopausal status, based on cohort and case-control studies published before 2012 S-148
Table 6.26S	Summary of meta-analyses for specific categories of exposure to secondhand smoke (spouse, home, workplace, childhood, childhood and adulthood) for all studies of breast cancer combined and stratified by menopausal status, based on cohort and case-control studies published before 2012 S-150
Table 6.27S	Comparison of relative risks (RRs) from selected summaries of meta-analyses for active smoking <i>versus</i> exposure to secondhand smoke for all studies of breast cancer combined and stratified by study design, based on cohort and case-control studies published before 2012 S-152
Table 6.28S	Associations between smoking and overall mortality in cancer patients S-153
Table 6.29S	Associations between smoking and overall survival in cancer patients S-167
Table 6.30S	Associations between smoking and cancer-related mortality S-173
Table 6.31S	Associations between smoking and developing a second primary cancer in cancer patients S-180
Table 6.32S	Associations between smoking and cancer recurrence S-184
Table 6.33S	Associations between smoking and cancer response S-189
Table 6.34S	Associations between smoking and treatment-related toxicity in cancer patients S-191

Chapter 7. Respiratory Diseases S-203

Table 7.2S	Population-based cohort studies of cigarette smoking and asthma induction in children and adolescents S-203
Table 7.3S	Studies of cigarette smoking and asthma induction in adults S-205
Table 7.4S	Studies of cigarette smoking, exacerbation of asthma, and natural history in adults S-208
Table 7.5S	Studies on tobacco use and tuberculosis (TB) infection S-211
Table 7.6S	Studies on tobacco use and tuberculosis (TB) disease S-217
Table 7.7S	Studies on tobacco use and recurrent tuberculosis (TB) S-241
Table 7.8S	Studies on tobacco use and tuberculosis (TB) mortality S-244
Table 7.10S	Studies of risk of cigarette smoking and idiopathic pulmonary fibrosis (IPF), 1990–2011 S-250

Chapter 8. Cardiovascular Diseases S-255

Table 8.6S	Detailed description of studies on smokefree laws and coronary events S-255
Table 8.7S	Detailed description of studies on smokefree laws and cerebrovascular accidents S-281
Table 8.8S	Detailed description of studies on the relationship between smokefree laws and other heart disease S-287

Chapter 9.	Reproductive Outcomes	S-297
Table 9.3S	Summary of studies of orofacial clefts and maternal smoking, 2002–2011	S-297
Table 9.4S	Summary of studies of maternal smoking and clubfoot, 1999–2011	S-300
Table 9.5S	Summary of studies of maternal smoking and gastroschisis, 1999–2011	S-302
Table 9.6S	Summary of studies of maternal smoking and congenital heart defects, 1999–2011	S-304
Table 9.7S	Summary of studies of maternal smoking and craniosynostosis, 1999–2011	S-307
Table 9.8S	Summary of studies of maternal smoking and anorectal atresia, 1999–2011	S-308
Table 9.10S	Studies on associations between prenatal smoking and disruptive behavioral in children, 2000–2012	S-309
Table 9.11S	Studies on associations between prenatal smoking and anxiety and depression in children, 2000–2012	S-329
Table 9.12S	Studies on the associations between prenatal smoking and Tourette syndrome in children, 2000–2011	S-333
Table 9.13S	Studies on associations between prenatal smoking and intellectual disability in children, 2000–2009	S-334
Table 9.14S	Association between maternal smoking and ectopic pregnancy, studies included in 2001–2010 Surgeon General's reports and subsequently published through March 2013	S-335
Table 9.15S	Studies on the effect of maternal active smoking on spontaneous abortion (SAB) risk	S-340
Table 9.16S	Experimental studies of the association between smoking and erectile dysfunction	S-342
Table 9.17S	Cross-sectional studies of the association between smoking and the risk of erectile dysfunction	S-343
Chapter 10.	Other Specific Outcomes	S-347
Table 10.1S	Summary of evidence from case-control studies on the association between smoking and age-related macular degeneration (AMD)	S-347
Table 10.2S	Summary of evidence from cross-sectional studies on the association between smoking and age-related macular degeneration (AMD)	S-356
Table 10.3S	Summary of evidence from prospective cohort studies on the association between smoking and age-related macular degeneration (AMD)	S-362
Table 10.4S	Summary of evidence from other types of studies on the association between smoking and age-related macular degeneration (AMD)	S-370
Table 10.5S	Studies on the association between active smoking and dental caries	S-374
Table 10.6S	Studies on exposure to tobacco smoke and dental caries	S-379
Table 10.7S	Studies on smoking and failure of dental implants	S-383
Table 10.8S	Characteristics of studies included in the meta-analysis on smoking and diabetes	S-393
Table 10.14S	Studies on the association between smoking and rheumatoid arthritis (RA) risk	S-400
Table 10.15S	Studies on the association between smoking and rheumatoid arthritis (RA) severity	S-403
Table 10.16S	Studies on the association between smoking and rheumatoid arthritis (RA) treatment response	S-405
Table 10.17S	Studies on the association between smoking and systemic lupus erythematosus (SLE) risk	S-406
Table 10.18S	Studies on the association between smoking and systemic lupus erythematosus (SLE) severity and manifestations	S-408
Table 10.19S	Studies on smoking and systemic lupus erythematosus (SLE) treatment response	S-409
Table 10.20S	Characteristics of the studies on the effects of current smoking on Crohn's disease or ulcerative colitis	S-410
Table 10.21S	Characteristics of the studies on the effects of former smoking on Crohn's disease or ulcerative colitis	S-427

Chapter 11. General Morbidity and All-Cause Mortality S-437

- Table 11.1S Studies on the association between smoking and all-cause mortality S-437
Table 11.2S Studies on the association between smoking and poor general health S-439
Table 11.3S Studies on the association between smoking and relative risk of poor functional status S-441
Table 11.4S Studies on the association between smoking and SF-36 or SF-12 scores S-444
Table 11.5S Studies on the association between smoking and other measures of health and function S-446
Table 11.6S Studies on the association between smoking and hospitalizations S-448
Table 11.7S Studies on the association between smoking and outpatient visits S-450
Table 11.8S Studies on the association between smoking and nursing home stays S-451
Table 11.9S Studies on the association between smoking and costs S-452
Table 11.10S Annual per capita spending on health care, by smoking status and age group (2008 dollars) S-453
Table 11.11S Studies on the association between smoking and workplace absenteeism (days absent) S-454
Table 11.12S Studies on the association between smoking and relative risk of workplace absenteeism S-456

Chapter 6

Cancer

Table 6.3S	Case-control studies on smoking and primary liver cancer	S-3
Table 6.4S	Cohort studies on smoking and primary liver cancer	S-12
Table 6.5S	Prospective studies of cigarette smoking and colorectal cancer incidence, published 2002–2009	S-21
Table 6.6S	Case-control studies of cigarette smoking and colorectal cancer incidence, published 2001–2008	S-26
Table 6.7S	Prospective studies of cigarette smoking and colorectal cancer mortality, published 2002–2009	S-28
Table 6.8S	Prospective cohort studies on the association between cigarette smoking and prostate cancer incidence and mortality	S-30
Table 6.9S	Epidemiologic cross-sectional studies on the association between cigarette smoking and stage and histologic grade at diagnosis of prostate cancer	S-45
Table 6.10S	Cohort studies on the association between cigarette smoking and risk of prostate cancer progression, case fatality, and all-cause mortality in men with prostate cancer	S-48
Table 6.11S	Reports on levels of endogenous hormones and smoking in premenopausal women (n = 22)	S-52
Table 6.12S	Reports on levels of endogenous hormones and smoking in postmenopausal women (n = 17)	S-57
Table 6.14S	Cohort study reports of the association between active cigarette smoking and risk of breast cancer, based on studies published before 2012 (n = 15)	S-60
Table 6.15S	Case-control study reports of the association between active cigarette smoking and risk for breast cancer, based on studies published from 2000 to 2011 (n = 34)	S-75
Table 6.16S	Evaluation of reports on exposure to active cigarette smoking for meta-analyses, based on cohort studies before 2012 and case-control studies published between 2000 and 2011 for meta-analyses, by location, study design, size of analytic sample, type of referent group, meta-analysis categories, and design or analysis issues (n = 65)	S-109
Table 6.17S	Summary of meta-analyses for measures of active cigarette smoking for all studies combined and stratified by study design, based on cohort studies published before 2012 and case-control studies published from 2000 to 2011	S-118
Table 6.18S	Reports of premenopausal and postmenopausal relative risks (RRs) by study and meta-analysis RRs for the association of active smoking (ever, pack-years) with risk for breast cancer, based on cohort studies published before 2012 and case-control studies published from 2000 to 2011 (n = 20)	S-120
Table 6.19S	Reports of estrogen receptor status relative risks (RRs) for the association of active cigarette smoking (ever, cigarettes/day) with risk for breast cancer, based on cohort studies published before 2012 and case-control studies published from 2000 to 2011 (n = 17)	S-123
Table 6.20S	Reports on the association between active cigarette smoking and risk of a second primary contralateral breast cancer (n = 7)	S-125

Table 6.21S	Modification of risk for breast cancer associated with smoking by <i>NAT2</i> phenotype, based on two meta-analyses and one pooled analysis, stratified by menopausal status	<i>S-126</i>
Table 6.22S	Reports on cohort studies of the association between exposure to secondhand smoke and relative risk (RR) for breast cancer incidence, based on studies published before 2012 included in the 2006 Surgeon General's report (n = 7)	<i>S-127</i>
Table 6.23S	Reports on case-control studies of the association between exposure to secondhand smoke and relative risk (RR) for breast cancer incidence, based on studies published before 2012 but not included in the 2006 Surgeon General's report (n = 11)	<i>S-132</i>
Table 6.24S	Evaluation of reports on exposure to secondhand smoke among 171 nonsmokers, based on 10 cohort and 24 case-control studies of breast cancer published before 2012 for meta-analyses, by location, study design, analytic sample size, meta-analysis categories, and design or analysis issues (n = 39)	<i>S-142</i>
Table 6.25S	Summary of meta-analyses for the broadest categories of exposure to secondhand smoke (adult–any source, ever in lifetime, most comprehensive) for all studies of breast cancer combined and stratified by menopausal status, based on cohort and case-control studies published before 2012	<i>S-148</i>
Table 6.26S	Summary of meta-analyses for specific categories of exposure to secondhand smoke (spouse, home, workplace, childhood, childhood and adulthood) for all studies of breast cancer combined and stratified by menopausal status, based on cohort and case-control studies published before 2012	<i>S-150</i>
Table 6.27S	Comparison of relative risks (RRs) from selected summaries of meta-analyses for active smoking <i>versus</i> exposure to secondhand smoke for all studies of breast cancer combined and stratified by study design, based on cohort and case-control studies published before 2012	<i>S-152</i>

Note: CI = confidence interval; NR = not reported; OR = odds ratio; pack-years = the number of years of smoking multiplied by the number of packs of cigarettes smoked per day; RR = relative risk.

^aResults are reported by relative risk unless noted otherwise.

^bResults are adjusted for multiple variables, including grade.

^cResults are adjusted for multiple variables, including stage and grade.

^dTable 3S in the report by Merrick and colleagues (2004) appears to have erroneous labels for the comparisons made.

^eResults are adjusted for multiple variables, including stage.

^fResults are adjusted for multiple variables, including pathologic stage and grade.

Table 6.11S Reports on levels of endogenous hormones and smoking in premenopausal women (n = 22)

Study	Population	Sample/period	Definition of smoking (number of subjects)	Findings among smokers: Estimate of effect (95% CI or p value)	Comments
MacMahon et al. 1982	• 106 White women • 25–49 years of age	Overnight urine specimen FP (days 10–11) LP (days 21–22)	Nonsmoker (n = 44): ≤100 cigarettes smoked during lifetime Former smoker (n = 23) Current smoker (n = 39)	• Levels of E1, E2, and E3 in smokers were similar to nonsmokers during FP • Total levels of E1, E2, and E3 decreased 29% (10–43) during LP • Little difference in former smokers	Stronger effects during ovulatory cycles; adjusted for age
Michnovicz et al. 1986	• 27 nonobese women with normal-length menstrual cycle • Age (mean): approximately 30 years	Blood and urine samples over 48 hours after administration of radiolabeled E2 FP (days 1–10), in morning 5 samples during LP (days 19–25)	Smoker (n = 14): ≥15 cigarettes/day	• 2-hydroxylation increased 50% (p <0.001) • Urine E3 and E3/E1 decreased 40% (p <0.01)	No difference during FP vs. LP; age and BMI were similar in nonsmokers and smokers, so no adjustments were made
Ernster et al. 1987	• 562 women	Breast fluid by nipple aspiration and blood sample	Current, former, and never smoker	• E2 hydroxylation increased 50% (p <0.001) • 2OHE1 increased (p <0.02), E3 decreased (p <0.05) • No difference in 16αOHE1, E2, E1, and total estrogens	No adjustments were made for BMI, age, etc.
Michnovicz et al. 1988	• 29 nonobese women • 21–44 years of age	Urine samples over 48 hours after administration of radiolabeled E2 Mid-FP (days 1–12)	Smoker (n = 15): 15–30 cigarettes/day Cotinine not detected in nonsmokers	• E1 increased per pack-year of smoking (p = 0.05)	Adjusted for previous thyroid disease
Longcope and Johnston 1988	• 88 women (47 premenopausal) • Age (mean): 50 years	Radiolabeled steroid infusion Blood and urine samples at baseline	Smoker (n = 23): 10 cigarettes/day for ≥10 years	• Metabolic clearance rates decreased for testosterone, androstenedione, and E1 were not significant in premenopausal women (p <0.05) • Increased plasma androstenedione (p <0.02) • No difference in E1 and E2 • No difference in SHBG, steroid production rates, and aromatization of androgens	No difference after adjusting for weight; no interaction between menopausal status and smoking for any of variables

Table 6.11S Continued

Study	Population	Sample/period	Definition of smoking (number of subjects)	Findings among smokers: Estimate of effect (95% CI or p value)	Comments
Zumoff et al. 1990	<ul style="list-style-type: none"> • 16 volunteers with normal ovulatory and luteal function • 25–35 years of age 	Blood samples on 17 days over cycle, and more frequently around mid-cycle (ovulation)	Smoker (n = 8): ≥20 cig/ per day for ≥3 years	<ul style="list-style-type: none"> • Progesterone increased 37% during FP but not LP (p <0.0001) • E2 increased 23% during early FP (p <0.001) and 12.5% (p = approximately 0.05) through FP, but results were not significant • Slightly decreased mean LH 	Smoking may stimulate adrenocortical hormone secretion
Key et al. 1991	<ul style="list-style-type: none"> • Women recruited from Guernsey Breast Cancer Study with menstrual cycle lengths of 21–35 days • Serum E2 and progesterone (n = 147) • Serum DHEA-S (n = 411) • Urinary steroids (n = 105) • ≥35 years of age 	24-hour urine sample and 1 blood sample	Current smoker: 1–10, 11–20, and ≥21 cigarettes/day E2 and progesterone (n = 69) DHEA-S (n = 97) Urinary steroids (n = 20)	<ul style="list-style-type: none"> • No difference in serum E2, progesterone, or DHEA-S • No difference in 6 urinary steroids (primarily androgens) • Overall effect was not significant 	Adjusted serum values for cycle day, age, and BMI; adjusted urine values for age, BMI, and parity
Berta et al. 1992	<ul style="list-style-type: none"> • 684 nonobese fertile women • 25–52 years of age 	24-hour urine sample and 3 blood samples on days 21–24 of LP	Smoker (n = 237): >10 cig/ per day for ≥5 years	<ul style="list-style-type: none"> • Plasma progesterone decreased 15% (p <0.05) • Plasma prolactin decreased 20% (p <0.002) • No difference in E1 and E2 	Age did not affect results
Daniel et al. 1992	<ul style="list-style-type: none"> • 52 women • 20–35 years of age 	Blood collected after overnight fast	Current smoker (n = 25): 16.9 (mean) cigarettes/day Former smoker (n = 11)	<ul style="list-style-type: none"> • No difference in cortisol, E2, and testosterone • Levels of cortisol, E2, and testosterone were not significant in adjusted model • SHBG increased (p <0.006) 	Age, height, and weight were similar in both groups; data were adjusted for sum of 8 skinfold thicknesses

Table 6.11S Continued

Study	Population	Sample/period	Definition of smoking (number of subjects)	Findings among smokers: Estimate of effect (95% CI or p value)	Comments
Thomas et al. 1993	• 46 fertile, premenopausal women	Blood, saliva, and urine samples collected on days 8, 9–11, 12, 13–17, and 18 of menses	Smoker (n = 25): >5 cigarettes/day for ≥1 year	<ul style="list-style-type: none"> No difference in plasma E2 during FP during LP No difference in salivary progesterone during LP No difference in plasma testosterone, androstenedione, SHBG, and DHEA-S No difference in urinary E1, E2, and E3 Overall effect was not significant 	Data suggest that antiestrogenic effect does not work through changes in estrogen metabolism or pituitary/follicular endocrine function
Cramer et al. 1994	• 224 women, some with a family history of ovarian cancer • 26–50 years of age	1 blood sample during early FP (days 1–3)	Current smoker (n = 42)	<ul style="list-style-type: none"> Mean FSH increased 14–21% (p = 0.03) in current and former smokers (>10 pack-years) 	Effect of smoking was still significant after adjusting for age
Cooper et al. 1995	• 290 women • 38–49 years of age	1 blood sample during early FP (days 2–4)	Current smoker (n = 31): smoked in past 2 years	<ul style="list-style-type: none"> Mean FSH increased 66% (28–116%) in current smokers Mean FSH increased 57% at <10 cigarettes/day Mean FSH increased 76% at 10–20 cigarettes/day Mean FSH increased 39% (4–86) in those exposed to SHS No difference in FSH in former smokers or prenatal exposure 	None of the factors examined were confounders; significant interaction with age; effects investigated during menopausal transition period
Key et al. 1996	• Women recruited from Guernsey Breast Cancer Study (n = 167) • ≥34 years of age	24-hour urine sample collected 3–11 days after onset of menstruation (FP) or 3–11 days before (LP)	Current smoker (n = 53)	<ul style="list-style-type: none"> E1 decreased 0–16% E2 decreased 4–15% E3 decreased 30% during early FP E3 decreased 5–22% later in cycle 	Findings were not significant after adjusting for time of cycle, age, and BMI
Westhoff et al. 1996	• 175 parous women with normal length menstrual cycles • 21–36 years of age	Daily first-morning urine sample on day 10 of menses Blood sample three times during LP	Current smoker (n = 48)	<ul style="list-style-type: none"> No difference in mean LP progesterone in blood or urine E2 in urine decreased 21% (p = 0.04) during LP 	Four anovulatory women were excluded; adjusted for creatine (decreased differences in E2); some dose-response effects

Table 6.11S Continued

Study	Population	Sample/period	Definition of smoking (number of subjects)	Findings among smokers: Estimate of effect (95% CI or p value)	Comments
Backer et al. 1999	• 3,114 women from the National Health and Nutrition Examination Survey (United States national sample) • 36–60 years of age	1 convenient blood sample	Smoker: smoked during 5 days before examination	• Increased FSH (p <0.001)	Cycle timing was unknown, but tried to exclude samples obtained close to time of ovulation on basis of LH-to-FSH ratio
Lucero et al. 2001	• 498 women, not in a depressive state, from Harvard Study of Moods and Cycles • 36–44 years of age	1 blood sample during early FP (days 1–5)	Current smoker (n = 52) Former smoker (n = 72)	• FSH increased 12% (p <0.05) • E2 increased 8% (p <0.05) • No difference in LH or SHBG	E2 was not significant in adjusted model; FSH values were not adjusted; findings for current smokers adjusted for age, BMI, calories, use of alcohol and caffeine, cholesterol, and cycle day; no difference between current smokers and former smokers, no dose-response effect
Sowers et al. 2001	• 611 women from the Michigan Bone Health & Metabolism Study • 25–50 years of age	Blood sample drawn once per year after an 8-hour fast on days 3–7 of FP	Current, former, and never smoker	• Increased testosterone levels in current and former smokers (p <0.0001)	Adjusted for factors, including BMI
Verkasalo et al. 2001	• 636 women who reported having ≥10 menstrual cycles during previous 12 months • 20–44 years of age	Blood sample	Current smoker (n = 49) Former smoker (n = 171) Never smoker (n = 416)	• Increased E2 in smokers compared with former and never smokers (p = 0.003) • No difference in SHBG, FSH, progesterone, and LH	Adjusted for age, BMI, physical activity, use of alcohol, family history of breast cancer, age at menarche, etc.
Jernström et al. 2003	• 513 nulliparous women • 17–35 years of age	Morning blood sample on random day (timing calculated)	Current smoker (yes/no)	• 20HE/16α-OHE increased slightly (19%) before adjustment (p = 0.06) but not after adjustment (p = 0.76) among women not using oral contraceptives • No effect on either metabolite alone	Adjusted for age, race, and cycle day

Table 6.11S Continued

Study	Population	Sample/period	Definition of smoking (number of subjects)	Findings among smokers: Estimate of effect (95% CI or p value)	Comments
Windham et al. 2005	• 403 women in reproductive years from the Kaiser Permanente health maintenance organization	Daily urine sample collected through 2–7 cycles Adjustment of hormone values for creatinine	Smoker: cigarettes/day, from daily diary and averaged over 100–150 cycles	<ul style="list-style-type: none"> Mean FSH increased 20–35% and was significant on some days Mean FSH increased at >10 cigarettes/day During early FP, E1 conjugates (estrone sulfate and estrone glucuronide) increased 25% and progesterone metabolites increased 35% ($p < 0.05$) at >10 cigarettes/day During LP, progesterone decreased 25% ($p = 0.06$) at >20 cigarettes/day 	Adjusted for age, race, history of pregnancy, BMI, and use of alcohol and caffeine; some dose-response effects
Gallicchio et al. 2006	• 353 pre- and perimenopausal women • 45–54 years of age	Blood sample collected in morning	Current smoker (n = 25) Former smoker (n = 235)	<ul style="list-style-type: none"> No difference in E2 and E1 Overall effect was not significant 	Findings were based on univariate analyses only
Cochran et al. 2008	• 628 pre- and perimenopausal women • 45–54 years of age	Blood sample collected in morning	Current smoker (n = 58) Former smoker (n = 242)	<ul style="list-style-type: none"> Current smokers had increased levels of androstenedione ($p = 0.01$) and increased androgen/estrogen ratios ($p = 0.04$) Former and current smokers had decreased levels of progesterone ($p = 0.04$) 	Adjusted for age, race, BMI, current use of alcohol, and number of days since last menstrual period

Note: **2OHE** = 2-hydroxyestrone; **16 α -OHE** = 16 α -hydroxyestrone; **BMI** = body mass index; **CI** = confidence interval; **DHEAS** = dehydroepiandrosterone sulfate; **E1** = estrone; **E2** = estradiol; **E3** = estriol; **FP** = follicular phase; **FSH** = follicle-stimulating hormone; **LH** = lutenizing hormone; **LP** = luteal phase; **OHE** = hydroxyestrone; **pack-years** = the number of years of smoking multiplied by the number of packs of cigarettes smoked per day; **SHBG** = sex hormone binding globulin; **SHS** = secondhand smoke.

Table 6.12S Reports on levels of endogenous hormones and smoking in postmenopausal women (n = 17)

Study	Study population	Sample/period	Definition of smoking (number of subjects)	Findings in smokers: Estimate of effect (95% CI or p value)	Comments
Ernster et al. 1987	• 289 women	Breast fluid by nipple aspiration and blood sample	Current, former, and never smoker	<ul style="list-style-type: none"> No difference in E1, E2, and SHBG in breast fluid or serum Overall effect was not significant 	Adjusted for menopausal estrogen use and thyroid hormone use
Friedman et al. 1987	• 25 women, after natural menopause and between 1.5–6 years before the study	Morning blood sample after 12-hour fast	Smoker (n = 9) for >20 years	<ul style="list-style-type: none"> Smokers had increased levels of cortisol (p <0.001), progesterone (p <0.05), 17-hydroxyprogesterone (p <0.0005), androstenedione (p <0.05), and testosterone (p <0.05) No difference in E1, E2, dihydrotestosterone, and dehydroepiandrosterone sulfate 	No difference in BMI or age at menopause
Trichopoulos et al. 1987	• 220 women, ≥1 year after menopause • 54–66 years of age	Overnight urine sample	Current smoker (n = 97)	<ul style="list-style-type: none"> Smokers had increased levels of DHEAS (p <0.001) and androstenedione (p = 0.003) No difference in E1, E2, testosterone, and SHBG 	Dose-response trend was observed; adjusted for age and BMI
Khaw et al. 1988	• 233 White women • 60–79 years of age	Plasma sample	Current smoker (n = 46)	<ul style="list-style-type: none"> Decreased metabolic clearance rates for testosterone, androstenedione, and E1 were not significant in premenopausal women (p <0.05) Increased plasma androstenedione (p <0.02) No difference in E1 and E2 No difference in SHBG, steroid production rates, and aromatization of androgens 	No difference after adjusting for weight; no interaction between menopausal status and smoking for any of the variables
Longcope and Johnston 1988	• 88 women (47 premenopausal) • Age (mean): 50 years	Radiolabeled steroid infusion Blood and urine samples at baseline	Smoker (n = 23): 10 cigarettes/day for ≥10 years	<ul style="list-style-type: none"> Metabolic clearance rates decreased for testosterone, androstenedione, and E1 were not significant in premenopausal women (p <0.05) Increased plasma androstenedione (p <0.02) No difference in E1 and E2 No difference in SHBG, steroid production rates, and aromatization of androgens 	No difference after adjusting for weight; no interaction between menopausal status and smoking for any of variables

Xue et al. 2011 ^a	<ul style="list-style-type: none"> Nurses' Health Study-I 121,700 nurses enrolled to evaluate risk factors for breast cancer and CVD Analysis restricted to 111,140 women for active cigarette smoking analysis Average follow-up: 14 years 30–55 years of age United States 	8,772 incident cases (invasive)	<ul style="list-style-type: none"> Self-administered questionnaire at enrollment Data collected for smoking status (never, former, current), cigarettes/day, duration, pack-years, timing in relation to menarche, first birth, and menopause, and time since cessation (former) Data collected for secondhand smoke exposure (See Table 6.22S) Subgroups evaluated and stratified by menopausal status, passive smoking status, timing of smoking status, and changes in BMI 	<ul style="list-style-type: none"> Risk significantly increased in ever, former and current smokers Risk significantly positively associated with cigarettes/day, duration, and pack-years of smoking Positive association with pack-years of smoking before menopause; inverse association after menopause (results not shown) 	<p>Status:</p> <p>Never: 1.00</p> <p>Ever: 1.07 (1.02–1.12)</p> <p>Former: 1.06 (1.01–1.11)</p> <p>Current: 1.09 (1.02–1.17)</p> <p>Duration (Years):</p> <p><20: 1.04 (0.98–1.11)</p> <p>20–39: 1.07 (1.00–1.14)</p> <p>≥40: 1.15 (1.04–1.27)</p> <p>p-trend = 0.01</p> <p>Cigarettes/Day: Current</p> <p>Never 1.00</p> <p>1–14: 1.04 (0.94–1.15)</p> <p>15–24: 1.06 (0.96–1.17)</p> <p>≥25: 1.14 (1.02–1.29)</p> <p>p trend = 0.02</p> <p>Cigarettes/Day: Former</p> <p>Never: 1.00</p> <p>1–14: 1.02 (0.97–1.09)</p> <p>15–24: 1.11 (1.04–1.18)</p> <p>≥25: 1.08 (0.99–1.18)</p> <p>p trend = 0.003</p> <p>Pack-years:</p> <p>Never: 1.00</p> <p>1–10: 1.00 (0.94–1.07)</p> <p>11–20: 1.08 (1.01–1.16)</p> <p>21–30: 1.07 (1.00–1.15)</p> <p>31–40 1.16 (1.07–1.26)</p> <p>41–50 1.05 (0.94–1.18)</p> <p>≥50 1.19 (1.07–1.33)</p> <p>p trend = 0.001</p> <p>Age at Smoking Initiation:</p> <p>Never:</p> <p>≥20: 1.07 (0.99–1.15)</p> <p>18–19: 1.08 (1.01–1.14)</p> <p>≤17: 1.04 (0.99–1.11)</p> <p>p trend = 0.01</p>	Controlled for age, family history, age at menarche, height, BMI at 18 years of age, oral contraceptive use, history of benign breast disease, physical activity, alcohol use, passive smoking at home and at work, age at first birth, parity, and current BMI, age at menopause, menopausal status, and HRT use

Table 6.14S *Continued*

Note: Study-specific results are not intended to be a complete reporting of all findings. When available, results for ever, status, duration, cigarettes/day, pack-years, age at initiation, and timing with first pregnancy (smoking before or during first pregnancy) are reported. Unless otherwise specified, the definition of the reference group is based on a no active-only exposure, which includes individuals with exposure to secondhand smoke. When available, results for ever smoking using a NA/NP reference group are reported; however, similar results for the other measures are not reported in the table. Data from cohort studies for exposure to secondhand smoke are summarized in Table 6.22S. All results reported by the study may not appear in the summary table. **BMI** = body mass index; **cig/day** = cigarettes smoked per day; **CI** = confidence interval; **CVD** = cardiovascular disease; **ER** = estrogen receptor; **HR** = hazard ratio; **HRT** = hormone replacement therapy; **NA/NP** = no active/no passive; **OC** = oral contraceptive; **pack-years** = the number of years of smoking multiplied by the number of packs of cigarettes smoked per day; **PostM** = postmenopausal; **PR** = progesterone receptor; **RR** = relative risk; **USDHHS** = United States Department of Health and Human Services.

^aReport that overlaps with another from the same study population shown in this table and reported in Table 6.16SA.

Table 6.15S Case-control study reports of the association between active cigarette smoking and risk for breast cancer; based on studies published from 2000 to 2011 (n = 34)

DeRoo et al. 2011a	<ul style="list-style-type: none"> Case-control study designed to evaluate the association between smoking during first pregnancy and breast cancer risk. 1985–2000 ≤65 years of age 1,099 incident cases (in-situ, invasive) ascertained through the population-based cancer registries 10,922 controls selected by linkage with Department of Licensing data; up to 10 controls were matched to cases by year, age at first birth, race/ethnicity and birth outcome Washington state 	<ul style="list-style-type: none"> Data was collected by linkage to state birth and fetal death records and vital records for maternal characteristics Any smoking reported during first pregnancy was defined as exposure 	<ul style="list-style-type: none"> No association for smoking during first pregnancy and risk of breast cancer 	<p>Status: during first pregnancy</p> <p>No: 1.00</p> <p>Yes: 0.8 (0.7–0.9)</p> <p>Status during first pregnancy: residents for at least 5 years</p> <p>No: 1.00</p> <p>Yes: 1.0 (0.8–1.1)</p>	Controlled for age at first birth, year of delivery, race/ethnicity, birth outcome, and imputed and known maternal prenatal alcohol use

Note: Study-specific results are not intended to be a complete reporting of all findings. When available, results for ever, status, duration, cigarettes/day, pack-years, age at initiation, and timing with first pregnancy (smoking before or during first pregnancy) are reported. Unless otherwise specified, the definition of the reference group is based on a no active-only exposure, which includes individuals with secondhand smoke exposure. When available, results for ever smoking using a no active/no passive reference group are reported; however, similar results for the other measures are not reported in the table. Data from case-control studies for exposure to secondhand smoke are summarized in Table 6.25S. All results reported by the study may not appear in the summary table. **BMI** = body mass index; **cig/day** = cigarettes smoked per day; **CI** = confidence interval; **CVD** = cardiovascular disease; **ER** = estrogen receptor; **HR_T** = hormone replacement therapy; **NAT₂** = N-acetyltransferase 2; **NA/NP** = no active/no passive; **NSAIDs** = nonsteroidal anti-inflammatory drugs; **OC** = oral contraceptive; **OR** = odds ratio; **OWHHS** = Ontario Women's Diet and Health Study; **OWHS** = Ontario Women's Health Study; **P** = passive; **pack-years** = the number of years of smoking multiplied by the number of packs of cigarettes smoked per day; **PostM** = postmenopausal; **PreM** = premenopausal; **PR** = progesterone receptor; **RR** = relative risk; **SEER** = Surveillance, Epidemiology, and End Results; **USDHHS** = United States Department of Health and Human Services.

^aReport that overlaps with another from the same study population shown in this table and reported in Table 6.16SA.

Table 6.16S Evaluation of reports on exposure to active cigarette smoking for meta-analyses, based on cohort studies before 2012 and case-control studies published between 2000 and 2011 for meta-analyses, by location, study design, size of analytic sample, type of referent group, meta-analysis categories, and design or analysis issues (n = 65)

Note: Analytic sample size is based on sample size reported for the ever smoking or smoking status category; for case-control studies, n of cases/n of controls, and for cohort studies, n of cases of total cohort. Measures of smoking are reported by meta-analysis category for studies with only 1 type of referent group. Measures of smoking are reported by each referent group for studies reporting both types of referent groups. **4-CBCS** = 4-Corners Breast Cancer Study; **AI** = age at initiation; **Carolina BCS** = Carolina Breast Cancer Study; **CD** = cigarettes/day; **D** = duration; **ColBCS** = Collaborative Breast Cancer Study; **CTS** = California Teachers Study; **ER+** = estrogen receptor positive; **FB** = timing in relation to first pregnancy/first birth; **CLUE-II** = Campaign Against Cancer and Heart Disease; **EV** = ever; **GENICA** = Gene Environment Interaction and Breast Cancer in Germany; **IWHS** = Iowa Women's Health Study; **JCCS** = Japan Collaborative Cohort Study for Evaluation of Cancer Risk; **JPHC** = Japan Public Health Center based prospective study; **KBCS** = Kuopio Breast Cancer Study; **KPMCP** = Kaiser Permanente Medical Care Program; **LICSP** = Long Island Breast Cancer Study Project; **LSS-RERF** = Life-Span Study of the Radiation Effects Research Foundation; **MPCDRF** = Monitoring Project on Cardiovascular Disease Risk Factors; **MS** = Migrant Study (Norwegian Component); **MWS** = Million Women Study; **NSWLCHS** = Norwegian-Swedish Women's Lifestyle and Health Cohort Study; **NBSS** = Canadian National Breast Screening Study; **NECSS** = National Enhanced Cancer Surveillance System; **NHS** = Nurses' Health Study; **OWHS** = Ontario Women's Health Study; **OWDHS** = Ontario Women's Diet and Health Study; **PV** = pack-years; the number of years of smoking multiplied by the number of packs of cigarettes smoked per day; **ST** = status (never, current, former); **TNBC** = triple negative breast cancer; **U.S.-RTS** = U.S. Radiologic Technologists Study; **WHI** = Women's Health Initiative Observational Study. Estimates were abstracted either directly or pooled using other measures of smoking to calculate an estimate for the appropriate category.

aStudies included in the pooled analysis restricted to nondrinkers conducted by the Collaborative Group on Hormonal Factors in Breast Cancer (Collaborative Group on Hormonal Factors in Breast Cancer et al. 2002). Smoking data was not provided in the publications cited and sample sizes are those provided in the collaborative report from the pooled analysis with the exception of 1 cohort study (Hiatt and Bawol 1984). This study was combined in the collaborative report with 3 other studies, and it is not possible to determine the individual sample sizes used in the pooled analysis based on 1,923 cases out of a combined cohort of 9,578 nondrinkers. The analytic sample size reported in the above table is based on each study and is the total number of cases out of the total cohort, regardless of drinking status.

bIndicates those reports that overlap with another report and which contribute to at least 1 meta-analysis. In the case of 1 cohort study (NHS-I) and 1 case-control study (ColBCS), 2 reports contributed to separate meta-analyses because they offered different measures (NHS-I: Egan et al., 2002 and Xue et al., 2011; ColBCS: Egan et al. 2003 and Ahern et al. 2009).

cSome data not included in meta-analyses when reported only as a continuous measure: Roddam et al. 2007 for duration, age at initiation and cigarettes/day.

dThis study was excluded from the comparison of the no active/no passive referent group with the no-active only referent group, as it was deleted after the meta-analysis of ever smoking due to small sample size and insufficient covariate adjustment.

Table 6.17S Summary of meta-analyses for measures of active cigarette smoking for all studies combined and stratified by study design, based on cohort studies published before 2012 and case-control studies published from 2000 to 2011

Measure of smoking	All studies:				Cohort studies:				Case-control studies:			
	n	RR (95% CI)	Q test (p _h)	n	RR (95% CI)	Q test (p _h)	n	RR (95% CI)	Q test (p _h)	n	RR (95% CI)	Q test (p _h)

Pack-years, ≥20 ⁱ	16	1.16 (1.11–1.21)	.304	6	1.15 (1.10–1.19)	.346	10	1.21 (1.09–1.34)	.314			
Pack-years, <20 ⁱ	16	1.09 (1.03–1.15)	.099	6	1.04 (1.00–1.09)	.872	10	1.20 (1.05–1.37)	.023			
Age at smoking initiation, <20y ^j	22	1.11 (1.07–1.16)	.088	8	1.09 (1.06–1.13)	.541	14	1.12 (1.02–1.22)	.029			
Age at smoking initiation, ≤16y ^k	19	1.08 (1.00–1.15)	.065	7	1.09 (1.02–1.17)	.327	12	1.04 (0.92–1.17)	.053			
Age at smoking initiation, ≥20y ^j	19	1.08 (1.05–1.12)	.673	8	1.07 (1.03–1.11)	.952	11	1.12 (1.04–1.19)	.291			
Smoking before/during first pregnancy ^m	22	1.10 (1.04–1.17)	<.001	9	1.16 (1.12–1.20)	.746	13	1.05 (0.94–1.18)	.001			

Note: **CI** = confidence interval; **n** = sample size (number of studies); **RR** = relative risk; **y** = years. Estimates were either abstracted directly or pooled using other measures of smoking to calculate an estimate for the appropriate category (Table 6.16S) provides more details about which studies contributed to exposure categories and reasons for exclusions). Cochran's χ^2 test, reported as the Q-test statistic, was used to assess between-study heterogeneity (p_h); p_h values reported in SAS as 0.000 due to rounding shown in table as <0.001. Summary estimates for all meta-analyses are based on random effects models.

^aExcludes 15 overlapping reports from 11 studies that were not the most recent or most complete report (Table 6.16SA) and 4 studies designed to evaluate smoking only before or during first pregnancy (Table 6.16SB), except for 2 meta-analyses. The estimates for the age at initiation meta-analysis were extracted from Egan and colleagues (2003) because estimates for age at initiation were not reported by Ahern and colleagues (2009). The estimates for the no active/no passive meta-analysis were extracted from Egan and colleagues (2002) rather than Xue and colleagues (2011), because the latter report used a no active-only referent group. See Figure 6.28 and 6.29.

^bExcludes 19 reports (note a), 2 cohort studies reported in the pooled analysis restricted to nondrinkers (Collaborative Group on Hormonal Factors in Breast Cancer et al. 2002), 8 studies with <210 cases, and 3 studies with a mixed referent group or insufficient adjustment (Table 6.16SB).

^cExcludes 32 reports (note b) and the remaining 3 studies with a design or analysis issue in Table 6.16B (Nordlund et al. 1997; Lash and Aschengrau 2002; Kruk 2007) (see Figure 6.30).

^dExcludes 35 reports (note c) and 5 studies that did not have a no active-only referent group (Table 6.16S). See Figure 6.31.

^eExcludes 35 reports (note c) and 16 studies that did not have a no active/no passive referent group (Table 6.16S). See Figure 6.32.

^fExcludes 35 reports (note c) and 5 studies that did not have an estimate for former or current smoking (Table 6.16S). See Figures 6.33 and 6.34.

^gExcludes 35 reports (note c), 1 study with a continuous measure only (Roddam et al. 2007), 10 studies with no available estimate for smoking duration (Hiatt and Fireman 1986; Hiatt et al. 1988; Manjer et al. 2000b; Gammon et al. 2004a; Sillanpaa et al. 2005a; Ha et al. 2007; Slattery et al. 2008; Ahern et al. 2009; Young et al. 2009; Andonova et al. 2010) (Table 6.16S). See Figure 6.35 for 20 or more years of smoking duration.

Table 6.17S Continued

- ^hExcludes 35 reports (*note c*), 1 study with a continuous measure only (Roddam et al. 2007), 2 studies where the highest category was for less than 20 cigarettes/day (Gram et al. 2005; Lissowska et al. 2005), and 9 studies with no available estimate for cigarettes/day (Olson et al. 2005; Ahern et al. 2009; Sillanpaa et al. 2005a; Andonova et al. 2010; Kropp and Chang-Claude 2002; Ha et al. 2007; Prescott et al. 2007; Slattery et al. 2008; Young et al. 2009) (Table 6.16S). See Figure 6.36 for 20 or more cigarettes/day.
- ⁱExcludes 35 reports (*note c*), 1 study where the highest category was for five or more pack-years (Sillanpaa et al. 2005a), and 13 studies with no available estimate for pack-years (Hiatt and Fireman 1986; Hiatt et al. 1988; Manjer et al. 2000b; van der Hel et al. 2003b; Al-Delaimy et al. 2004; Lissowska et al. 2006; Mechanic et al. 2006; Ha et al. 2007; Prescott et al. 2007; Roddam et al. 2007; Young et al. 2009; Andonova et al. 2010) (Table 6.16S). See Figure 6.37 for 20 or more pack-years.
- ^jExcludes 35 reports (*note c*), 1 study with a continuous measure only (Roddam et al. 2007), and 7 studies with no available estimate for age at initiation of smoking (Hiatt and Fireman 1986; Hiatt et al. 1988; Manjer et al. 2002; Band et al. 2002; van der Hel et al. 2003b; Sillanpaa et al. 2005a; Andonova et al. 2010) (Table 6.16S). See Figure 6.38 for less than 20 years of age at smoking initiation.
- ^kExcludes 43 reports (*note j*) and 3 studies that did not report a cutpoint of ≤ 16 years for age at initiation (Reynolds et al. 2004a; Li et al. 2005; Magnusson et al. 2007)
- ^lExcludes 43 reports (*note j*) and 3 studies that did not report a cutpoint of ≥ 20 years for age at initiation (Gammon et al. 2004a; Rollison et al. 2008; Egan et al. 2003) (Table 6.16SB).
- ^mExcludes the 15 overlapping reports (*note a*), 16 studies with a design or analysis issue and included in meta-analyses for only overall ever smoking (see Table 6.16SB), and 12 studies with no available estimate for smoking before first pregnancy (Hiatt and Fireman 1986; Hiatt et al. 1988; Manjer et al. 2000b; Johnson et al. 2000; Zheng et al. 2002a; van der Hel et al. 2003b; Sillanpaa et al. 2005a; Mechanic et al. 2006; Mechanic et al. 2005a; Andonova et al. 2009; Ahern et al. 2007; Roddam et al. 2010; Brown et al. 2010) (Table 6.16S). See Figure 6.39.

Table 6.18S Reports of premenopausal and postmenopausal relative risks (RRs) by study and meta-analysis RRs for the association of active smoking (ever, pack-years) with risk for breast cancer, based on cohort studies published before 2012 and case-control studies published from 2000 to 2011 (n = 20)

A. Cohort Studies (n = 6)

Exclusion of outlier ^j		1.18 (1.08–1.29)	1.07 (1.00–1.14)	—	—	

Note: One study reported data for pack-years, but estimates were restricted to parous women only and are not included in this table (Ha et al. 2007). Direct nonpooled estimates for ever smoking for the following studies: (Johnson et al. 2000; Band et al. 2002; Kropp and Chang-Claude 2002; Zheng et al. 2002a; Gammon et al. 2004a; Li et al. 2005; Lissowska et al. 2006; Magnusson et al. 2007; Prescott et al. 2007; Rollison et al. 2008). None of the summary estimates shown was associated with a statistically significant result for publication bias using the Begg or Egger statistic ($p \geq 0.05$). Results for the Q-test for heterogeneity are not shown in the table.

CI = confidence interval; **H** = Hispanic; **NHW** = non-Hispanic White.

^aSummary estimate for ever smoking pooled from estimates for former and current smokers reported within menopausal status (Hiatt and Fireman 1986; Reynolds et al. 2004a; Olson et al. 2005; Roddam et al. 2007; Luo et al. 2011b).

^bSummary estimate for ever smoking pooled from estimates for levels of cigarettes/day within menopausal status (Kruk 2007; Manjer et al. 2000b).

^cEstimates for categories of pack-years ≥ 20 pooled for meta-analysis.

^dSummary estimate for ever smoking pooled from estimates for levels of pack-years reported within menopausal status (Aherne et al. 2009; Xue et al. 2011). The estimates for pack-years reported in Xue and colleagues (2011) are defined as pack-years from menarche to before menopause (premenopausal); and pack-years after menopause (postmenopausal).

^eThe estimates for ever smoking are based on the full study sample using no-active only as the referent group. However, the estimates for pack-years are based on the subsample using the no active/no passive exposure referent group for those reporting a lifetime residential smoking history of >90%, which reduces the total sample size by 38%. Estimates for pack-years were not available for the no-active only referent group (Johnson et al. 2000).

^fApproximately 80% of the study population was premenopausal; approximately 13–16% classified as menopause unknown (Kropp and Chang-Claude 2002).

^gSummary estimates for ever smoking pooled across estimates for non-Hispanic White and Hispanic women within menopausal status; estimates for pack-years pooled across ethnicity for both 1–15 and >15 pack-years (Slater et al. 2008).

^hEstimate for premenopausal, based on women <45 years of age; estimate for postmenopausal, based on women >55 years of age; estimate for women 45–55 years of age excluded (Lissowska et al. 2006).

ⁱThe estimates by menopausal status are based on current smokers compared to never smokers; former smokers appear to be excluded. The majority of women were postmenopausal (age range: 50–74 years). The exact percent for premenopausal women could not be determined (Magnusson et al. 2007).

^jThe exclusion of the outlier estimate reported for the study by Kruk (2007).

Table 6.19S Reports of estrogen receptor status relative risks (RRs) for the association of active cigarette smoking (ever, cigarettes/day) with risk for breast cancer, based on cohort studies published before 2012 and case-control studies published from 2000 to 2011 (n = 17)

Note: **CI** = confidence interval; **ER** = estrogen receptor; **HER2** = human epidermal growth factor receptor 2; **PR** = progesterone receptor.

^aEstimates for ex-smokers and for categories of cigarettes/day among current smokers pooled for an estimate of ever smoking (London et al. 1989).

^bEstimates for the four categories of duration pooled for an estimate of ever smoking (Al-Delaimy et al. 2004).

^cEstimates for current and former smoking pooled across ER/PR status for an estimate of ever smoking (Luo et al. 2011b). Overlaps with an analysis restricted to an evaluation of triple negative ($n = 300$) and ER+ ($n = 2,479$) (Kabat et al. 2011) (See Table 6.16S in this report).

^dEstimates for current and former smoking pooled for an estimate of ever smoking (McTiernan et al. 1986; Huang et al. 2000a; Manjer et al. 2001; Rabstein et al. 2010).

^eEstimates for levels of numbers of cigarettes/day among ever smokers pooled for an estimate of ever smoking (Morabia et al. 1998).

^fEstimates for current and former smoking pooled across PR categories for an estimate of ever smoking (Britton et al. 2002).

^gEstimates for pack-years pooled across menopausal status pooled for an estimate of ever smoking (Cotterchio et al. 2003). Discordant ER/PR results were not included in the manuscript.
^hEstimates for active smoking only and passive and active smoke exposure pooled across PR categories for an estimate of ever smoking. Referent group based on no active/no passive exposure (Gammon et al. 2004a).

ⁱEstimates for ever smokers pooled across PR categories (ER+/PR+, ER+/PR-) to calculate an estimate for ever smoking by ER+ status; (ER-/PR+) did not have a calculated estimate as there were only 6 cases (Li et al. 2005).

^jCI for >14 cigarettes/day for ER- status appears to have a typographical error (Lissowska et al. 2006).

^kEstimates for current and former smoking pooled across ER/PR/HER2 status for an estimate of ever smoking (Trivers et al. 2009).

Table 6.20S Reports on the association between active cigarette smoking and risk of a second primary contralateral breast cancer (n = 7)

Study	Design/population	Cases/noncases	Measure of smoking: RR (95% CI)
Kato et al. 1986 ^a	<ul style="list-style-type: none"> • Case control • 1964–1984 • 49 years of age • Japan 	115/230	≥10 cigarettes/day: 0.41 (p = 0.05)

Note: **CI** = confidence interval; **pack-years** = the number of years of smoking multiplied by the number of packs of cigarettes smoked per day; **RR** = relative risk; **SEER** = Surveillance, Epidemiology, and End Results Program; **WECARE** = Women's Environmental Cancer and Radiation Epidemiology Study.

^aAscertained from women identified through a cancer clinic; no information on stage is provided. The referent group for measure of smoking is based on women who smoked <10 cigarettes/day.

^bAscertained from women identified through either the state cancer registry (Horn and Thompson 1988; Trentham-Dietz et al. 2007a) or through the SEER Program (Bernstein et al. 1992) and diagnosed with a first primary breast cancer (controls) or a second primary breast cancer diagnosed in the contralateral breast (cases).

^cAscertained from women identified through clinics with Stage I-II breast cancer over a median follow-up time of 8.9 years. Rate ratio calculated for this table based on cumulative incidence for smokers = 5% and 10% for nonsmokers at 10-year follow-up. Missing data for smoking history for 38% of subjects.

^dAscertained from women identified through population-based cancer registries with either a first primary invasive breast cancer with no regional lymph node involvement (controls) or a second primary in situ or invasive breast cancer diagnosed in the contralateral breast no more than 1 year after the first breast cancer diagnosis (cases). The referent group was never smokers for all categories with the exception of 'Ever, risk period', which was defined as starting prior to or during the period between the first diagnosis and the reference date and stopping during or after this period.

^eAscertained from women identified through a population-based cancer registry with Stage I-IIIB and ER+ breast cancer; baseline = first breast cancer diagnosis; reference = date of contralateral breast cancer diagnosis for cases and for controls the date of the matched patient's contralateral diagnosis.

Note: **CI** = confidence interval; **RR** = relative risk.

^aEver smokers compared with never smokers for 13 studies (4,837 cases, 6,017 controls). (Ambrosone et al. 1996; Hunter et al. 1997; Millikan et al. 1998; Delfino et al. 2000; Morabia et al. 2000; Krajnovic et al. 2001; Chang-Claude et al. 2002; Egan et al. 2003; van der Heijden et al. 2003b; Alberg et al. 2004; Lilla et al. 2005; van der Heijden et al. 2005; Sillanpää et al. 2005a).

^bReferent group based on never smokers. Acetylator status based on common use across studies: rapid equals presence of one rapid acetylator allele, and slow equals presence of three common variant alleles (*NAT2**5, *NAT2**6, and *NAT2**7). Summary estimates for ever smokers based on 13 studies (6,757 cases, 7,454 controls) (Ambrosone et al. 1996; Hunter et al. 1997; Millikan et al. 1998; Morabia et al. 2000; Krajnovic et al. 2001; Chang-Claude et al. 2002; Egan et al. 2003; van der Heijden et al. 2004; Alberg et al. 2004; Kocabas et al. 2005; Sillanpää et al. 2005a; Lissowska et al. 2006). Estimates for pack-years based on 8 studies (Ambrosone et al. 1996; Morabia et al. 2000; Chang-Claude, et al. 2004; Sillanpää et al. 2005b; Alberg et al. 2004; Egan et al. 2002; Chang-Claude et al. 2003; van der Heijden et al. 2003; van der Heijden et al. 2005; Lissowska et al. 2006). There was no significant heterogeneity across studies for pack-years. Summary estimates, independent of acetylator status: <20 pack-years (RR = 1.14; 95% CI, 1.03–1.25); ≥20 pack-years (RR = 1.26; 95% CI, 1.12–1.43).

^c p_h for heterogeneity.

^dBased on a pooled analysis of nested case-control studies from 7 cohorts (6,900 cases, 9,903 controls). Fast acetylation status is based on the combination of rapid plus intermediate phenotypes.

Table 6.22S Reports on cohort studies of the association between exposure to secondhand smoke and relative risk (RR) for breast cancer incidence, based on studies published before 2012 included in the 2006 Surgeon General's Report (n = 7)

Study	Design/population	Number of breast cancer events	Data collection/subgroup analyses	Findings for exposure to secondhand smoke	Measures of exposure to secondhand smoke: RR (95% CI)	Confounders
Gram et al. 2005	<ul style="list-style-type: none"> Women's Lifestyle and Health Study Norwegian-Swedish Cohort 102,098 women were enrolled in 1991–1992 to evaluate lifestyle risk factors for multiple health outcomes Average follow-up: 8–9 years Ages 30–50 years Norway and Sweden 	Approximately 377 incident cases (invasive) among 36,773 never active smokers	<ul style="list-style-type: none"> Self-administered questionnaire at enrollment Data collected from never smokers who reported having lived with a smoker or lived with a smoker during childhood Data collected for active cigarette smoking (see Table 6.14S) 	<ul style="list-style-type: none"> Nonsignificant increased risk for breast cancer among subjects ever exposed to passive smoke Nonsignificant results reported for different combinations of exposure during childhood and adulthood (data not provided) 	Ever in Lifetime: NA/NP: 1.00 Passive, ever: 1.21 (0.98–1.50)	Controlled for age at enrollment, menopausal status, number of children, age at birth of first child, HRT, use of oral contraceptives, BMI, alcohol use

Young et al. 2009	<ul style="list-style-type: none"> Population-based study of secondary analysis to evaluate the association between breast cancer and smoking using combined data from 2 studies with similar target populations, data collection methods, and measures of smoking: 6,065 total cases; 2,751 incident cases (invasive) among nonsmokers ascertained through the Ontario Cancer Registry 6,371 total controls; 3,097 nonsmokers frequency matched by 5-year age groups and selected randomly (age-stratified) from the Ontario Ministry of Finance rolls (for OWHS) and from a random-digit dialing list (for OWDHS) OWHS (June 1996–May 1998) • OWDHS (June 2002–April 2003) • Ages 25–75 years • Canada 	<ul style="list-style-type: none"> Self-administered, mailed questionnaire Data collected for ≥2 hours/day of exposure during childhood or adulthood or both Data collected on exposure to active smoking (see Table 6.15S) 	<ul style="list-style-type: none"> No association between risk for breast cancer and exposure to passive smoke 	Lifetime: NA/NP: 1.00 Passive: 0.97 (0.88–1.08)	Controlled for age at menarche, age at birth of first child, parity, BMI, use of oral contraceptives, hormone replacement therapy, alcohol use, menopausal status, family history, history of benign breast disease, and household income

Note: Data from case-control studies for active cigarette smoking are summarized in Table 6.15S. Numbers for cases and controls are based on nonsmokers, a smaller percentage of subjects than the total included for analyses of active cigarette smoking. All results reported by the study may not appear in the summary table.

BMI = body mass index; **CI** = confidence interval; **HRT** = hormone replacement therapy; **NA/NP** = no active/no passive; **NSAIDs** = nonsteroidal anti-inflammatory drugs; **OWDHS** = Ontario Women's Diet and Health Study; **OWHS** = Ontario Women's Health Study; **SES** = socioeconomic status.

^aOverlapping reports based on the same study population.

Table 6.24S Evaluation of reports on exposure to secondhand smoke among 171 nonsmokers, based on 10 cohort and 24 case-control studies of breast cancer published before 2012 for meta-analyses, by location, study design, analytic sample size, meta-analysis categories, and design or analysis issues (n = 39)

Note: Two studies based entirely on deceased subjects were excluded from all meta-analyses based on exposure to secondhand smoke (Hirayama 1984; Wartenberg et al. 2000). These studies are considered in the section, "Exposure to Tobacco Smoke and Breast Cancer Mortality." Estimates for Adult-any Source and Ever in Lifetime are based on different measures of smoking for those reports providing both measures. Analytic sample size is based on reported number of nonsmokers; for case-control studies, n of cases/n of controls and for cohort studies, n of cases of total count. **1** = estimate directly reported; **2** = estimate inferred (i.e., any adult from spouse). Estimates were abstracted either directly or pooled using other measures of smoking to calculate an estimate for the appropriate category. **USDHHS** = United States Department of Health and Human Services.

^aStudy included in the 2006 Surgeon General's Report (USDHHS 2006).

^bA series of three reports provide data on the Carolina Breast Cancer Study. Changes were made to the three estimates (Adult–Any Source, Adult–Home, Most Comprehensive) for "All Women" used in the meta-analysis for the 2006 Surgeon General's report. Marcus and colleagues (2000) reported on only exposure to passive smoke during childhood. The study by Mechanic and colleagues (2006), published after the 2006 Surgeon General's Report, was based on a larger number of nonsmokers and provided data on estimates for Adult–Any Source, Adult–Home, Spouse, and Most Comprehensive, which replaced the estimates from Millikan and colleagues (1998), as used in the 2006 Surgeon General's report. However, because Mechanic and colleagues (2006) did not report results by menopausal status, these estimates are based on the initial report (Millikan et al. 1998), which included considerably fewer nonsmokers.

^cIndicates which report contributes estimates to the meta-analyses when there are overlapping studies.

^dTwo reports provide data on the California Teachers Study. Estimates for Childhood, Adult–Work, Adult–Any Source, Ever in Lifetime, and Most Comprehensive were based on the most recent report (Reynolds et al. 2009). The estimate for Adult–Work exposure was based on any exposure at an age younger than 20 years for 17% of subjects. The estimates for Adult–Spouse, Adult–Home, and both Adulthood and Childhood were based on the earlier report (Reynolds et al. 2004a). The measure for Adult–Home was based on the earlier report because it was specific to exposure at home as an adult, whereas the estimate in the later report included childhood or adulthood exposure at home. Estimates for pre- and postmenopausal status for each exposure measure come from the respective reports. There was no reported estimate for Adult–Work exposure by menopausal status.

^eEleven studies excluded after the initial meta-analysis because of design or analysis issues due to inclusion of smokers in passive analyses, inclusion of deceased subjects for whom information was collected from proxies, inclusion of prevalent cases, or small sample size (<100 cases) or insufficient adjustment for relevant covariates (Sandler et al. 1985a; Smith et al. 1994; Morabia et al. 1996; Lee et al. 1999; Lash and Aschengrau 1999, 2002; Zhao et al. 1999; Delfino et al. 2000; Nishino et al. 2001; Alberg et al. 2004; Krusk 2007).

^fThe study reported by Metsola and colleagues (2005) was excluded from all meta-analyses because it was based on the same study population as that reported by Sillanpaa and colleagues (2005a), which adjusted for reproductive factors, use of alcohol, and family history. The latter study was based primarily on postmenopausal women (60%) but did not adjust for menopausal status.

Table 6.24S Continued

^gThe estimates from Xue and colleagues (2011) for Adult–Work and Adult–Home were pooled across two categories (occasionally and regularly). The estimate for Childhood was pooled across three categories (mother only, father only, and both parents). The estimate for Ever in Lifetime was pooled across four categories based on frequency (occasional/regular), location (home/work), and age (<20 or ≥20 years).

^hEstimates by menopausal status based on Wells' (1991) reanalysis of data provided by Sandler and colleagues (1985a).

ⁱEstimates reported by Smith and colleagues (1994) for all women are also used in the analyses for premenopausal women because all subjects were diagnosed before 36 years of age (Smith et al. 1994). Changes were made to two of the eight estimates extracted from the report by Smith and colleagues (1994) as used in the meta-analysis for the 2006 Surgeon General's report. The estimate for Adult–Any Source was replaced to be the same as that used for Adult–Home, based on the pooled estimates across years of “Adult Exposure from Living with Other Smokers” (RR = 1.33; 95% CI, 0.74–2.40; n = 94 cases, 100 controls), rather than the original “Adult Only, Period of Exposure” (RR = 3.13; 95% CI, 0.73–13.31; n = 21 cases, 27 controls), which increased the sample size and the precision of the RRs and CIs. The estimate for Childhood was replaced with a pooled estimate across two levels of cigarette years under “Total Childhood Exposure” (RR = 1.18; 95% CI, 0.64–2.17; n = 94 cases, 100 controls), rather than the original “Child Only, Period of Exposure” (RR = 1.33; 95% CI, 0.16–10.83; n = 8 cases, 17 controls). These changes were also applied to the premenopausal estimates.

^jEstimates reported by Morabia and colleagues (1996) appear to be based primarily on postmenopausal women (approximately 70% for cases, 60% for controls), and not adjusted for menopausal status. A single estimate is reported for premenopausal women (RR = 3.6; 95% CI, 1.6–8.2), but the estimate may not have been adjusted for potential confounders; no data are provided. Comments do not address postmenopausal women specifically. The report from Morabia and colleagues (2000) was not included because it presented results from a subsample of the study population previously reported in the earlier study (Morabia et al. 1996).

^kChanges were made to the estimates for all women extracted from the report by Jee and colleagues (1999) as used in the meta-analysis for the 2006 Surgeon General's report. The category Home was added and based on the pooled estimates used for Spouse (Jee et al. 1999).

^lChanges were made to three of the four estimates extracted from the report by Nishino and colleagues (2001) as used in the meta-analysis for the 2006 Surgeon General's report. The estimate for Adult–Home was replaced with the pooled estimate for “Husband, and Other Members for Smoking Status in the Household” (RR = 0.69; 95% CI, 0.44–1.06), rather than the original pooled estimate (RR = 0.49; 95% CI, 0.33–0.74), which was based on three estimates that adjusted for only age. Estimates for Adult–Any Source and Most Comprehensive were based on this new estimate. There was no adjustment for menopausal status.

^mEstimates from Krupp and Chang-Claude (2002) based primarily on premenopausal women (approximately 80%).

ⁿChanges were made to the estimates for Spouse, Adult–Home, and Adult–Any Source extracted from Gammon and colleagues (2004a), as used in the meta-analysis for the 2006 Surgeon General's Report. The estimate for Spouse was replaced with the pooled estimate levels for months across “Ever Passively Exposed to Spouse” (n = 260), which was based on Adult–Only Exposure, rather than the set of nonpooled estimates for “Exposed to Passive Smoke Only” (n = 433), based on lifetime exposure as either an adult or as a child in the residence. This resulted in the deletion of menopausal estimates for these three categories because estimates were not associated with pre- and postmenopausal status. An estimate for Ever in Lifetime exposure was added and based on the general category “Exposed to Passive Smoke Only,” as noted previously.

^oEstimates from Shrubsole and colleagues (2004) based on only women who reported being married

^pEstimates from Hanaoka and colleagues (2005) by menopausal status measured at baseline rather than at diagnosis. Approximately 1% of cases were ascertained through death records.

^qEstimates originally reported in Lissowska and colleagues (2006) are primarily for postmenopausal women (80%). Estimates for adult exposure by menopausal status were reported in a subsequent publication by Lissowska and colleagues (2007), in response to an editorial by Johnson (2007).

^rEstimate from Roddam and colleagues (2007) based primarily on premenopausal women (93%).

^sEstimates from Lin and colleagues (2008) based primarily on postmenopausal women (76%).

^tEstimates from Pirie and colleagues (2008) based primarily on postmenopausal women (93%). Estimate for passive exposure to tobacco smoke as a child or as an adult were reported by menopausal status and were used for only the Ever in Lifetime and Most Comprehensive categories.

^uEstimates from Rollison and colleagues (2008) based primarily on postmenopausal women (84%).

^vEstimates from Ahern and colleagues (2009) for some categories—including estimates for all women by Spouse, Home, and the Workplace and the estimates for menopausal status by Adult–Any Source, Child, and Both—were excluded from the meta-analyses because active smokers were included.

^wEstimate from Luo and colleagues (2011b) for Childhood and Adulthood was based on pooled estimates across several categories (Childhood and Adult at Home, Childhood and Adult at Work, Childhood and Adult at Home and at Work). All women were postmenopausal.

Table 6.25S Summary of meta-analyses for the broadest categories of exposure to secondhand smoke (adult-any source, ever in lifetime, most comprehensive) for all studies of breast cancer combined and stratified by menopausal status, based on cohort and case-control studies published before 2012

Note: Estimates were abstracted either directly or pooled using other measures of smoking to calculate an estimate for the appropriate category. Cochran's χ^2 test, reported as the Q-test statistic, was used to assess between-study heterogeneity (p_h); p_h values reported in SAS as 0.000 due to rounding shown in table as <0.001. Table 6.24S provides more details about which studies contributed to exposure categories and reasons for exclusions. Summary estimates for all meta-analyses are based on random-effects models. CI = confidence interval; N = sample size (number of studies); RR = relative risk.

Table 6.25S Continued

^aAll studies regardless of whether the majority of subjects were primarily premenopausal or postmenopausal. This includes those studies that had a small percentage (<20%) of either pre- or postmenopausal women (Kropp and Chang-Claude 2002; Sillanpaa et al. 2005a; Roddam et al. 2007; Pirie et al. 2008; Rollison et al. 2008; Lin et al. 2008), no premenopausal women (Luo et al. 2011b) or no postmenopausal women (Smith et al. 1994). Because some studies did not stratify results by menopause, the numbers of pre- and postmenopausal studies do not always sum to equal All Studies.

^bExcludes two studies (Zhao et al. 1999; Kruk 2007) from the appropriate categories (Table 6.24S).

^cExcludes two studies (*note b*) and three studies (Jee et al. 1999; Lash and Aschengrau 1999; Lash and Aschengrau 2002) from the appropriate categories (Table 6.24S).

^dIndicates that the estimate did not change because studies were excluded based on previous sensitivity analyses or did not include an estimate for the specific measure of smoking by menopausal status.

^eExcludes five studies (*notes b and c*) and five studies (Sandler et al. 1985a; Smith et al. 1994; Delfino et al. 2000; Nishino et al. 2001; Alberg et al. 2004) from the appropriate categories (Table 6.24S).

^fExcludes 10 studies (*notes b, c, and e*) and 1 study (Morabia et al. 1996) (Table 6.24S, *note e*), an extreme outlier from All Studies for all three measures of smoking and from premenopausal estimates for Ever in Lifetime and Most Comprehensive. See Figure 6.43.

Table 6.26S Summary of meta-analyses for specific categories of exposure to secondhand smoke (spouse, home, workplace, childhood, childhood and adulthood) for all studies of breast cancer combined and stratified by menopausal status, based on cohort and case-control studies published before 2012

Category of exposure to secondhand smoke	All studies ^a			Premenopausal			Postmenopausal

Note: Estimates were abstracted either directly or pooled using other measures of smoking to calculate an estimate for the appropriate category. Cochran's χ^2 test, reported as the Q-test statistic, was used to assess between-study heterogeneity (p_h). Table 6.24S provides more details about which studies contributed to exposure categories and reasons for exclusions. Summary estimates for all meta-analyses are based on random-effects models. **CI** = confidence interval; **N** = sample size (number of studies);

Table 6.26S Continued**RR** = relative risk.

^aAll studies regardless of whether the majority of subjects were primarily premenopausal or postmenopausal. This includes those studies that had a small percentage (<20%) of either pre- or postmenopausal women (Kropp and Chang-Claude 2002; Sillanpaa et al. 2005a; Roddam et al. 2007; Pirie et al. 2008; Rollison et al. 2008; Lin et al. 2008), no premenopausal women (Luo et al. 2011b) or no postmenopausal women (Smith et al. 1994). Because some studies did not stratify results by menopause, the numbers of pre- and postmenopausal studies do not always sum to equal All Studies.

^bExcludes seven studies from All Studies: (Sandler et al. 1985a; Smith et al. 1994; Morabia et al. 1996; Jee et al. 1999; Nishino et al. 2001; Alberg et al. 2004; Kruuk 2007); three studies from Premenopausal: (Sandler et al. 1985a; Smith et al. 1994; Kruuk 2007); and two studies from Postmenopausal (Sandler et al. 1985a; Kruuk 2007).

^cExcludes seven studies (*note b*) in addition to one more (Delfino et al. 2000) from All Studies and from Premenopausal due to small sample size and insufficient adjustment for relevant covariates.

^dExcludes one study (Smith et al. 1994) from All Studies and from Premenopausal due to small sample size and insufficient adjustment for relevant covariates.

^eIndicates that the estimate did not change because studies were excluded based on previous sensitivity analyses or did not include an estimate for the specific measure of smoking by menopausal status.

Table 6.27S Comparison of relative risks (RRs) from selected summaries of meta-analyses for active smoking versus exposure to secondhand smoke for all studies of breast cancer combined and stratified by study design

Table 6.28S Associations between smoking and overall mortality in cancer patients

Study	Design/population	Smoking definition	Findings (all comparisons are vs. never unless otherwise specified)	Comments
Goodman et al. 1990	• 675 lung cancer patients	C/F/N	• Males: – Never: 1.0 – Former: 1.0 (0.6–1.5) – Current: 0.8 (0.5–1.3) • Females: – Never: 1.0 – Former: 1.6 (1.0–2.4) – Current: 1.5 (0.9–2.4)	1979–1985; detailed interview
Sobue et al. 1991	• 267 lung adenocarcinoma patients	C/F/N	• Former: 1.89 (0.88–4.04) • Current: – <50 Pack-years: 1.28 (0.68–2.40) – 50+ Pack-years: 2.38 (1.21–4.67)	1978–1987
Brownman et al. 1993	• 115 Stage III–IV head/neck cancer patients	Current/noncurrent	• 2.3 (1.2–4.2)	Smoking during RT; patients treated with RT +/- chemotherapy
Kirschner et al. 1995	• 136 vulvar cancer patients	Smoker/ Nonsmoker	• 6.34 (p <0.01)	Smoking not clearly defined; chart review
Deleyannis et al. 1996	• 649 head/neck cancer patients	C/F/N	• Current ≥ 20 cpd 1.0 (referent) • Current <20 cpd 0.68 (0.38–1.24) • Quit <15 yrs ago 0.99 (0.54–1.80) • Never/quit ≥15yrs: 0.42 (0.24–0.74)	1983–1987; structured interview; referent category = current smokers with ≥20 cpd
Boffetta et al. 1997	• 222 male laryngeal cancer patients	Cigarettes per day	• 0–15 cpd 1.0 (referent) • 16–25: 1.4 (0.9–2.2) • ≥26: 1.8 (1.1–2.9)	1979–1982; chart review
Yu et al. 1997	• 25,436 cancer patients from institutional tumor registry.	Ever/never	• 1.47 (1.4–1.6)	1979–1982; chart review
Fujisawa et al. 1999	• 369 Stage I NSCLC patients	Pack-years	• <30: 1.0 (referent) • 30+: 2.41 (1.24–4.96)	1981–1993; patients treated with surgery
de Perrot et al. 2000	• 1046 Stage I–IV NSCLC patients	Pack-years	• 0: 1.0 (referent) • 1–40: 1.82 (1.22–2.72) • >40: 1.48 (0.99–2.21)	1977–1996; chart review, patients treated with surgery
Hommura et al. 2000	• 215 Stage I–IV NSCLC patients	Ever/Never	• 1.73 (0.80–3.73)	1976–1994; chart review; smoking not clearly defined
Huang et al. 2000	• 877 gastric cancer patients	C/F/N	• Ever: 2.10 (1.06–4.18) • Current: 2.54 (1.22–5.29)	1988–1994; only male results, no analyses performed for women.

Table 6.28S Continued

Study	Design/population	Smoking definition	Findings (all comparisons are vs. never unless otherwise specified)	Comments
Palli et al. 2000	• 382 gastric cancer patients	C/F/N	• Former: 1.07 (0.78–1.47) • Current: 1.04 (0.75–1.45)	1985–1987; structured questionnaire in year prior to surgery
Sweeney et al. 2000	• 555 renal cell cancer patients	C/F/N	• Former: 1.2 (0.8–1.7) • Current: 1.7 (1.2–2.5)	1995–1997; chart review
Lippman and Farrow 2001	• 1166 T1–3 NSCLC patients	C/F/N	• Former: 2.28 (0.58–8.92) • Current: 4.39 (1.11–17.29)	Randomized trial; patients treated with isoretinoic acid
Brownman et al. 2002	• 148 Stage III–IV head/neck cancer patients	Current/noncurrent	• 1.17 (p = 0.07)	Comparison group is recent quitters who stopped smoking within 12 weeks prior to RT; patients treated with RT
Chiyo et al. 2003	• 931 lung cancer patients	Ever/Never	• 1.51 (1.14–2.08)	1980–1990; chart review; smoking not clearly defined (smoking history)
de Cassia Braga Ribeiro et al. 2003	• 530 head/neck cancer patients	Smoker/nonsmoker	• 1.5 (p = 0.03)	1990–1997; smoking not clearly defined; chart review; patients treated with curative surgery
Myrdal et al. 2003	• 395 Stage I–III NSCLC patients	Current, non-current	• 1.3 (1.1–1.6)	1987–1999; chart review; patients treated with surgery
Tan et al. 2003	• 326 women with Stage I NSCLC	Ever, never	• 1.3 (1.0–1.8)	1996–1998
Videtic et al. 2003	• 186 limited stage SCLC patients	Current, non-current	• 1.86 (1.34–2.57)	1989–1999; chart review; patients treated with chemoradiotherapy
Chang et al. 2004b	• 114 CML patients	Ever/Never	• 1.72 (0.86–3.46)	1997–2001; patients treated with hematopoietic stem cell transplant. 1-year mortality
Nordquist et al. 2004	• 654 Stage I–IV NSCLC patients	Current, Never	• 1.33 (1.04–1.69)	(1985–2000, Moffitt)
Pickles et al. 2004	• 601 prostate cancer patients	Current/ Noncurrent	• 2.38 (p = 0.009)	1994–1997; 6 year mortality; patients treated with external beam RT; reference category includes never and former smokers
Sawabata et al. 2004	• 242 Stage IA NSCLC patients	Smoker	• Preoperative smoking yes: 5.706, p=0.1	1991–2003; patients treated with surgery; chart review; smoking not clearly defined

Table 6.28S Continued

Study	Design/population	Smoking definition	Findings (all comparisons are vs. never unless otherwise specified)	Comments
Tammemagi et al. 2004	• 1,155 lung cancer patients	Current, non-current	• 1.26 (1.08–1.47)	1995–1998; chart review
Toh et al. 2004	• 317 Stage I–IV NSCLC patients	Ever/Never	• 0.98 (0.704–1.375)	1999–2002; chart review
Dikshit et al. 2005a	• 931 laryngeal or hypopharyngeal cancer patients	Current cpd	• 1–15 cpd: 1.8 (1.1–3.1) • 16–25 cpd: 1.7 (1.0–2.9) • >25 cpd: 1.8 (1.1–3.1)	1979–1982
Ebbert et al. 2005	• 5229 lung cancer patients	C/F/N	• NSCLC – Former: 0.99 (0.86–1.13) – Current: 1.15 (1.00–1.32) • SCLC – Former: 1.05 (0.57–1.94) – Current: 1.08 (0.58–1.99)	1997–2002
Kawai et al. 2005	• 3082 Stage IA NSCLC patients	Pack-years	• <40 Pack-years: 1.0 • 40+ Pack-years: 1.129 (0.948–1.344)	1982–1997; chart review; patients treated with surgery
Sardari et al. 2005	• 321 Stage I–IIIB NSCLC patients	C/F/N	• Current: 1.0 • Recent quitters: 0.34 (0.16–0.71) • Former: 0.54 (0.35–0.84) • Never: 0.45 (0.21–0.97)	1991–2001; patients treated with surgery; detailed smoking information; recent quit within 3 months
Trivers et al. 2005	• 1,142 esophageal and gastric cancer patients	Ever/Never	• Esophageal adenocarcinoma – 0.86 (0.64–1.16) • Gastric cardia adenocarcinoma – 0.99 (0.71–1.38) • Esophageal squamous cell carcinoma – 0.99 (0.62–1.59) • Other gastric adenocarcinomas – 1.02 (0.79–1.32)	1993–1995
Wright et al. 2005	• 255 IB–IIB cervical cancer patients	Current/Noncurrent	• 3.69 (1.08–12.62)	Reference category includes former and never smokers
Wu et al. 2005	• 301 Stage I–III NSCLC patients	Smoker	• Stage I–II: 1.40 (0.997–1.97) • Stage II–III: 1.76 (1.17–2.66)	1990–2001; smoking not clearly defined in analysis; patients treated with surgery
Ando et al. 2006	• 1,976 NSCLC patients	Ever/Never	• 1.41 (1.19–1.67)	2002; chart review; patients from 84 institutions treated with gefitinib

Arrieta et al. 2012	• 914 stage I–IV lung cancer patients	Ever/never	• Unadjusted 0.56 ($p = 0.002$) • Adjusted: 1.04 (0.74–1.5)	2007–2010; median survival
Jerjes et al. 2012	• 67 oral cavity cancer patients treated with surgery	Smoking after treatment	• Smoking cessation: 1.0 (referent) • Reduced smoking: 0.98 • Smoker 20+ CPD: 0.14 ($p < 0.001$)	1998–2003; 5-year survival

Note: C/F/N = current/former/never; CML = chronic myelogenous leukemia; cpd = cigarettes per day; HRT = hormone replacement therapy; NSCLC = non-small-cell lung cancer; RT = radiotherapy; TCC = transitional cell carcinoma.

Table 6.30S Associations between smoking and cancer-related mortality

Study	Design/population	Smoking definition	Findings (all comparisons are vs. never unless otherwise specified)	Comments
A) Cancer-related mortality				
Thrasher et al. 1994	• 531 transitional cell cancer patients	Ever/never	• p = 0.85	1969–1990; chart review; smoking not clearly defined; patients treated with radical cystectomy
Fujisawa et al., 1999	• 369 Stage I NSCLC patients	Pack-years	• ≥30 Pack-years: 1.39 (0.66–2.91)	1981–93. Patients treated with surgery
Manjer et al. 2000a	• 792 breast cancer patient	C/F/N	• Former: 1.62 (0.51–5.07) • Current: 3.31 (1.57–6.95)	1977–1986; chart review; Malmö Mammographic Screening Trial
Brownman et al. 2002	• 148 Stage III–IV head/neck cancer patients	Current/noncurrent recent quitters	• 1.23 (p = 0.056)	Referent is quitters who stopped smoking within 12 weeks prior to RT; patients treated with RT
Frank et al. 2002	• 1,801 clear cell renal cell carcinoma patients	Ever/never	• 1.07 (0.91–1.26)	1970–1998; patients treated with surgery
Gorsky et al. 2004	• 322 patients with tongue cancer	Smoker/nonsmoker	• Reported as not statistically significant in the text. (p. 549)	1979–1994; chart review; smoking not clearly defined
Pickles et al. 2004	• 601 prostate cancer patients	Current/noncurrent	• 2.89 (p = 0.08)	1994–1997; patients treated with external beam RT
Kawai et al. 2005	• 3082 Stage IA NSCLC patients	Pack-years	• <40 Pack-years: 1.0 • 40+ Pack-years: 1.22 (0.98–1.51)	1982–97. Disease specific survival. Chart review. Patients treated with surgery
Wright et al. 2005	• 255 IB–IIB cervical cancer patients	Current/noncurrent	• 4.06 (1.15–14.38)	
Kjaerbye-Thygesen et al. 2006	• 295 Stage III ovarian cancer patients	C/F/N	• Former: 0.93 (0.67–1.30) • Current: 1.65 (1.22–2.24)	1994–1999; Danish Malignant Ovarian Cancer Study
Merrick et al. 2006	• 938 consecutive T1b–T3a prostate cancer patients	C/F/N	• Former: p = 0.19 • Current: p = 0.48	1995–2002; patients treated with brachytherapy +/- androgen deprivation therapy
Modesitt et al. 2006	• 3,562 endometrial cancer patients	Current/notcurrent	• 1.38 (1.09–1.75)	1995–2002

Table 6.30S Continued

Study	Design/population	Smoking definition	Findings (all comparisons are vs. never unless otherwise specified)	Comments
Munro et al. 2006	• 284 CRC patients	Current/Noncurrent	• 2.55 (1.40–4.64)	1997–1999; current defined as active smoking at first postoperative visit; patients treated with curative surgery
Nagle et al. 2006	• 676 primary epithelial ovarian cancer cases	C/F/N	• Former: 1.09 (0.86–1.39) • Current: 1.36 (1.01–1.84)	1990–1993
Williams et al. 2006	• 1073 Stage I–IIIB NSCLC patients treated with curative surgery	Pack-years	• <30: 1.0 (referent) • 30–50: 1.12 (0.81–1.54) • 50–75: 1.38 (1.01–1.90) • >75: 1.19 (0.86–1.65) • Smoking at diagnosis: 0.95 (0.73–1.24)	1997–2001. Post-recurrence mortality. Patients treated with curative surgery. Referent group includes patients with <30 Pack-years history
Chia et al. 2007	• 745 endometrial cancer patients	C/F/N	• Former: 1.4 (0.7–2.9) • Current: 0.5 (0.1–2.1)	1991–1994; structured health behavior assessment
Giovannucci et al. 2007	• 3,544 prostate cancer patients	Ever/Never	• 1.41 (1.04–1.91)	Health Professional Follow-Up Study; questionnaire every 2 years
Holmes et al. 2007	• 5,056 breast cancer patients	C/F/N	• Former: 0.93 (0.79–1.10) • Current: 1.00 (0.83–1.19)	Breast cancer mortality; Nurse's Health Study; repeated structured questionnaires
Hung JJ et al. 2007	• 445 Stage I NSCLC patients with tumors 3 cm or less	Pack-years	• 1.011 (1.004–1.018)	1980–2000; chart review; pack-years analyzed as continuous variable
Odongua et al. 2007	• Cervical cancer patients from 475,398 women in screening program	C/F/N	• Former: 1.31 (0.68–2.52) • Current: 2.00 (1.23–2.91)	1992
Sagiv et al. 2007	• 1,273 breast cancer patients	C/F/N	• Obese – Former: 0.91 (0.40–2.07) – Current: 1.97 (0.89–4.36)	1996–1997 Long Island Breast Cancer Study; Questionnaire following breast cancer diagnosis
Bittner et al. 2008	• 1,354 prostate cancer patients	C/F/N	• Reported as not statistically significant in the text. (p. 437) +/- androgen deprivation +/- external beam RT	1993–2004; patients treated with brachytherapy

Table 6.30S Continued

Study	Design/population	Smoking definition	Findings (all comparisons are vs. never unless otherwise specified)	Comments
Dal Maso et al. 2008	• 1,453 breast cancer patients	C/F/N	• Former: 1.27 (0.97–1.67) • Current <15 cpd: 1.39 (1.02–1.90) • Current ≥15 cpd: 1.23 (0.82–1.83)	1991–1994; structured questionnaire 1 year prior to diagnosis
Gong et al. 2008	• 752 prostate cancer patients	C/F/N	• Former ≥10 years: 0.45 (0.19–1.05) • Former <10 years: 1.48 (0.50–4.37) • Current: 2.66 (1.10–6.43)	1993–1996; cases from case-control study; structured interview
Parker et al. 2008	• 2,242 renal cell carcinoma patients	C/F/N	• Current: 0.93 (0.77–1.12)	1970–2002; patients treated with surgery.
Perng et al. 2008	• 299 stage IIIB–IV NSCLC	Ever/Never	• 1.52 (1.18–1.94)	2005–2006; patients who failed chemotherapy and treated with erlotinib
Toyooka et al. 2008	• 408 advanced or recurrent NSCLC patients	Ever/Never	• ≥20 pack-years: 1.0 (referent) • <20 pack-years: 1.0 (0.74–1.61) • Never: 0.76 (0.54–1.07)	Chart review; analyses based upon pack year
Yang et al. 2008	• 635 ovarian cancer patients responding to follow-up questionnaire	C/F/N	• Former: 0.91 (0.69–1.25) • Current: 0.94 (0.70–1.26)	1994–1995; follow-up questionnaire only answered by surviving patients
Coker et al. 2009	• 2,661 women with cervical cancer	Current/Not current	• 1.21 (1.01–1.46)	1995–2005
Hotta et al. 2009	• 365 NSCLC patients	Per pack year	• Males: 0.97 (0.95–1.00) • Females: 1.00 (0.96–1.04)	2000–2003; cancer related mortality; risks stated per pack year; patients treated with gefitinib
Marks et al. 2009	• 2,818 HLA identical sibling or matched unrelated donor allogeneic transplants for CML	Ever (High dose, low dose)/Never	• HLA-identical sibling donor group – Low dose: 1.14 (0.95–1.37) – High dose: 1.52 (1.14–2.04) • Unrelated donor group – Ever: 0.97 (0.76–1.25)	1990–2004
Nose et al. 2009	• 477 NSCLC patients tested for EGFR mutation	Ever/Never	• 2.0 (0.86–4.76)	1993–2007
Tiseo et al. 2009	• 651 stage IIIB–IV NSCLC	Ever/Never	• 1.71 (p<0.001)	Patients treated with gefitinib
Watters et al. 2009	• 16,640 prostate cancer patients	C/F/N	• Former: 1.03 (0.83–1.27) • Current: 1.69 (1.25–2.27)	1995–1996; NIH-AARP Diet and Health Study

Table 6.30S Continued

Study	Design/population	Smoking definition	Findings (all comparisons are vs. never unless otherwise specified)	Comments
Kim et al. 2010	• 342 NSCLC patients	Ever/Never	• 1.15 (0.82–1.62)	2006–8; chart review; patients treated with erlotinib or gefitinib
Nugent et al. 2010	• 111 stage II–IV cervical cancer patients	Ever/Never	• Reported as not statistically significant in the text. (p. 440)	2003–2007; chart review; patients treated with RT + chemotherapy
Sardari et al. 2010	• 239 NSCLC patients	Current/Noncurrent	• 1.62 (1.08–2.41)	1991–2001; patients treated with surgery
Weinmann et al. 2010	• 768 prostate cancer patients matched to 929 non-cancer controls	C/F/N	• Former: 1.0 (0.81–1.3) • Current: 1.5 (1.1–2.0)	1997–2001
Farshadpour et al. 2011	• 2,012 head/neck cancer patients	Current/Noncurrent	• 1.26 (0.86–1.85)	1980–2004; smoking combined with drinking in analysis
Kenfield et al. 2011	• 5,366 prostate cancer patients	C/F/N	• Former: 1.05 (0.86–1.27) • Current: 1.61 (1.11–2.32)	Health Professionals Follow-Up Study; questionnaire every 2 years
Kountourakis et al. 2011	• 49 patients with T2 esophageal cancer	Smoker/Nonsmoker	• 4.82 (1.38–16.81)	1997–2009; patients treated with surgery, RT, and chemotherapy
Maeda et al. 2011a	• 1,870 stage I–II NSCLC patients	Ever/Never	• (p<0.001)	1992–2007; chart review; patients treated with curative surgery
Ngô et al. 2011	• 257 patients with cervical cancer < 4 cm in diameter	Current smokers >10 cpd vs. ≤10 cpd	• 2.63 (1.30–5.34)	1985–2008; referent category includes light current + former + never smokers; patients treated with preoperative brachytherapy and surgery. 5-year mortality
Phipps et al. 2011	• 2,264 colorectal cancer patients	C/F/N	• Former: 1.14 (0.93–1.38) • Current: 1.30 (1.09–1.74)	1998–2007; structured questionnaire post-diagnosis
Richards et al. 2011	• 423 Stage I–III CRC patients	C/F/N	• 1.25 (1.02–1.53) univariate, p = 0.09 multivariate	1997–2007; smoking not clearly defined, likely current; patients treated with curative surgery
Shiono et al. 2011	• 201 stage I NSCLC patients	Ever/Never	• 1.3 (0.04–43.3)	2004–2008; chart review; smoking not clearly defined; patients treated with surgery
Yafi et al. 2011	• 2,287 bladder cancer cases	Smoker/Nonsmoker	• 1.30 (1.005–1.69)	1998–2008; chart review; treated with radical cystectomy
Bostrom et al. 2012	• 564 bladder cancer patients	Ever/Never	• Men: 1.7 (1.1–2.5) • Women: 1.2 (0.7–2.1)	1991–2008; chart review; treated with radical cystectomy

Table 6.30S Continued

Study	Design/population	Smoking definition	Findings (all comparisons are vs. never unless otherwise specified)	Comments
Gillison et al. 2012	• 502 stage III–IV head/neck cancer patients	Current/Noncurrent	• RT: 2.19 (1.48–3.25) • RT+CT: 2.73 (1.37–5.45)	Data from RTOG 9003 + RTOG 0129, phase III trials treating with RT +/- chemotherapy
Gridelli et al. 2012	• 780 stage IIIB–IV NSCLC patients	Ever/Never	• 1.24 (1.04–1.48)	Patients treated on randomized TORCH trial
Haughey et al. 2012	• 211 p16+ oropharyngeal cancer patients	C/F/N	• Disease free mortality – Current: 5.25 (1.39–19.85) • Disease specific mortality – Current: 5.36 (0.55–51.53)	1996–2010; patients treated with laser microdissection
Kawakita et al. 2012	• 222 patients with oral cavity cancer	Current/Noncurrent	• 2.08 (1.04–4.15)	2001–2005; disease free mortality; referent category is light smokers
Kroeger et al. 2012	• 802 renal cell carcinoma patients	Ever/Never	• 1.35 (1.09–1.67)	1989–2007; chart review
Lee et al. 2012b	• 670 stage IIIB–IV NSCLC patients	C/F/N	• Former: 1.02 (0.79–1.32) • Current: 1.61 (0.91–2.86)	Patients treated with erlotinib on TOPICAL trial
Lee et al. 2012a	• 924 stage IIIB–IV NSCLC patients	Ever/Never	• Not significant (Forest plot)	2006–2008; patients enrolled on phase III ZEPHYR trial in patients who failed EGFR therapy
Wang et al. 2012	• 301 stage II–IIIA NSCLC patients	Ever/Never	• 0.97 (0.72–1.29)	2000–2006; chart review; patients treated with surgery
Chang et al. 2013	• 245 stage IIIB–IV NSCLC patients	Ever/Never	• 1.20 (0.80–1.82)	2002–2011; patients treated with chemotherapy
Warren et al. 2013	• 5,185 cancer patients with 13 types of malignancy.	Current/Recent quit/ Former/Never	• Current vs. former: 1.23 (1.09–1.39) • Current vs. recent quit: 1.08 (0.94–1.25) • Current vs. never: 1.18 (1.03–1.36)	1982–1998; structured tobacco assessment; current smoking vs. variable referent categories
B) Cancer-related survival				
Chelghoum et al. 2002	• 642 AML patients	Ever/Never	• Pack-years – 0–20: 12.6 months – ≥20: 9.1 month (NS)	1984–1998; median survival; structured tobacco assessments by patients or relatives
			• Duration smoked (years) – 0–30: 12.6 months – ≥30: 8.2 months (p = 0.03)	

Table 6.30S Continued

Study	Design/population	Smoking definition	Findings (all comparisons are vs. never unless otherwise specified)	Comments
Videtic et al. 2003	• 186 limited stage SCLC	Current, non-current	• Current: 15.8 mo • Non-current: 14.8 mo (not significant)	1989–99. Disease free survival. Chart review. Patients treated with chemoradiotherapy
Wu et al. 2003	• 321 Stage I NSCLC patients	Pack-years	• 20 or less: 63.6% • >20: 49.5% (p<0.002)	1980–90. 10 year cancer related survival. Chart review. Patients treated with surgery
Fox et al. 2004	• 237 Stage I–III NSCLC patients	Current, non-current	• Stage I–II – Current: 25.3 mo – Non-current: 28.1 mo (p=0.32) • Stage III – Current: 20.3 mo – Non-current: 18.9 mo (p=0.65)	1991–2001. Median cancer specific survival. Chart review. Current smoking include patients who quit within 12 months of RT. Patients treated with RT
Izasa et al. 2004	• 402 Stage I lung cancer patients	Pack-years	• Cancer specific survival – 30+: 70.7% – <30: 79.3% (p=0.46) • Non-cancer specific survival – 30+: 67.7% – <30: 94.3% (p<0.0001)	1985–97. 10 year survival. Patients treated with surgery
Yamamoto et al. 2004	• 207 Stage I–IIIA NSCLC	Smoking habit	• Yes: 69.9% • No: 63.4% (not significant)	1990–5. Disease free survival. Smoking not clearly defined. Chart review
Guntinas-Lichius et al. 2006	• 69 patients with unknown primary of the head/neck	Smoker/Nonsmoker	• Reported as not statistically significant in the text	1987–2002; 5-year survival; chart review; smoking not clearly defined
Lee et al. 2006	• 575 stage IIIB–IV NSCLC patients	Ever/Never	• Progression free survival – Never: 3.7 mo – Ever: 1.7 mo (p<0.001)	2002–5. Median progression free survival. Chart review. Patients treated with gefitinib
Pine et al. 2007	• 731 Stage I–IV NSCLC patients	Pack-years	• White: 1.00 (0.99–1.00) • African American: 1.00 (0.99–1.01)	1998–2004. Pack-years analyzed as continuous variable
Hanagiri et al. 2008	• 770 stage I–IV NSCLC	Ever/Never	• Never: 70.2% • 20 Pack-years or less: 69.6% • >20 Pack-years: 67.3% (not significant)	1994–1995; chart review; patients treated with surgery
Sakao et al. 2008	• 121 NSCLC patients with tumors <2 cm	Ever/Never	• Ever: 80.4% • Never: 98.0% (p = 0.03)	1996–2006; chart review; patients treated with surgery
Boström et al. 2009	• 248 bladder cancer patients	Ever/Never	• 0.88 (p=0.055)	1986–2005; chart review; patients treated with radical cystectomy

Table 6.30S Continued

Study	Design/population	Smoking definition	Findings (all comparisons are vs. never unless otherwise specified)	Comments
Chang et al. 2010	• 110 NSCLC patients	Ever/Never	• Ever: 2.07 months • Never: 3.22 (p = 0.116)	2006–2008; median survival chart review
Chen et al. 2011a	• 202 head/neck cancer patients	Current/Noncurrent	• 0.65 (p = 0.01)	1998–2008; chart review; patients treated with RT +/- surgery
Junor et al. 2012	• 254 head/neck cancer patients	C/F/N	• Current: 55.8% • Former: 67.2% • Never: 82.0% (p = 0.045)	5-year cancer related survival

Note: Cancer related mortality = disease specific, disease free, cancer specific mortality or survival; chart review = tobacco information collected by chart review or where tobacco collection information is not clearly defined; NMIBC = nonmuscle invasive bladder cancer.

Table 6.31S Associations between smoking and developing a second primary cancer in cancer patients

Study	Design/population	Smoking definition	Findings (all comparisons are vs. never unless otherwise specified)	Comments
Hiyama et al. 1992	• 472 male laryngeal cancer patients	Current cpd	• 1–19: 2.0 (p <0.01) • 20–39: 2.2 (p <0.01) • ≥40: 2.5 (p <0.01)	1965–1975; observed/expected; chart review
Kaldor et al. 1992	• 98 HD patients with subsequent lung cancer matched to 259 HD controls	Ever/never	• 13.0 (3.0–59)	Lung cancer; chart review
Richardson et al. 1993	• 540 SCLC patients	Current smokers compared to general population	• General population: • Continue after diagnosis: 32 (12–69) • Quit after diagnosis: 11 (4.4–23)	1973–1989; patients enrolled on clinical trials through National Cancer Institute
van Leeuwen et al. 1995	• 30 HD patients with subsequent lung cancer matched to 82 HD controls	Current/noncurrent	• <1: 1.0 (referent) • 1–10: 2.9 (1.1–8.0) • >10: 6.2 (1.2–3.1)	1966–1986; lung cancer; chart review; current defined as smoking after diagnosis (pack-years)
Barbone et al. 1996	• 380 head/neck cancer patients	Smoking history	• All: – Never or very light: 1.0 (referent) – Light: 1.5 (0.5–4.9) – Intermediate: 2.7 (0.5–13.4) – Heavy: 4.3 (0.7–26.9) • Head and neck – Never or very light: 1.0 (referent) – Light: 2.3 (0.4–12.2) – Intermediate: 2.7 (0.5–13.4) – Heavy: 4.3 (0.7–26.9)	1984–1991; referent category included very light or never
Tucker et al. 1997	• 611 2-year survivors of SCLC	Current smokers compared to general population	• General population: • Continued after diagnosis: 17 (11–16) • Quit at diagnosis: 9.9 (5.3–17) • Quit prior to diagnosis: 9.4 (4.7–17)	Chart review; Lung Cancer Working Cadre
Kawahara et al. 1998	• 980 SCLC patients	Current smokers compared to general population	• General population: • Continue after diagnosis: 5.4 (2.7–9.6) • Quit after diagnosis: 1.6 (0.3–4.6)	1978–1992. Chart review; analysis in 70 patients with at least 2 years of survival
Kinoshita et al. 2000	• 1,614 stage I–III gastric cancer patients	C/F/N	• Former: 0.95 (0.42–2.13) • Current: 1.82 (1.02–3.26)	1978–1992; second primary; chart review
Obedian et al. 2000	• 1,029 early stage breast cancer patients	C/F/N	• Never: 1.0 (referent) • Former: 7.01 • Current: 8.96 (p = 0.06)	1970–1990; lung cancer incidence at 14.6 years; chart review; patients treated with surgery + RT

Table 6.31S Continued

Study	Design/population	Smoking definition	Findings (all comparisons are vs. never unless otherwise specified)	Comments
Kokawa et al. 2001	• 368 resected superficial esophageal cancers	Brinkman Index	• 1000+: 1.70 ($p = 0.006$)	1966–1998; second primary; referent group includes smokers and nonsmokers
Lippman et al. 2001	• 1166 T1-3 NSCLC patients	C/F/N	• Former: 3.10 (0.75–12.84) • Current: 2.72 (0.64–11.51)	Randomized trial
Travis et al. 2002	• 222 HD patients with lung cancer and 444 matched controls	Heavy/nonheavy	• Nonheavy: – RT-, chemotherapy-: 1.0 (referent) – RT+, chemotherapy-: 7.2 (2.9–21.2) – RT-, chemotherapy+: 4.3 (1.8–11.7) – RT+, chemotherapy+: 7.2 (2.8–21.6) • Heavy: – RT-, chemotherapy-: 6.0 (1.9–20.4) – RT+, chemotherapy-: 20.2 (6.8–68) – RT-, chemotherapy+: 16.8 (6.2–53) – RT+, chemotherapy+: 49.1 (15.1–187)	Lung cancer; chart review; nonheavy includes <1 PPD, former, and never
Ford et al. 2003	• 280 breast cancer patients with subsequent primary lung cancer matched to 300 breast cancer patients without lung cancer	C/F/N	• All: – Former: 3.68 (2.09–6.48) – Current: 12.90 (8.17–20.37) • Smoking and RT treatment – Noncurrent, No RT: 1.0 (referent) – Noncurrent, Yes RT: 0.54 (0.26–1.13) – Current, No RT: 6.00 (3.55–10.13) – Current, Yes RT: 9.00 (5.08–15.9)	1960–1997; lung cancer following breast cancer; chart review
Franchin et al. 2003	• 410 T1-T2 laryngeal cancer patients	Current/noncurrent	• 2.07 (calculated from data in text p. 769)	Chart review; no statistical testing
Gilbert et al. 2003	• HD patients: 199 with subsequent lung cancer matched with 393 without lung cancer	C/F/N	• Former: 6.8 (2.8–19.5) • Current: 24.0 (10.3–68)	1965–1994; lung cancer; chart review; all patients treated with RT
Matsubara et al. 2003	• 679 squamous cell esophageal cancer patients	Smoking habit	• 2.92 ($p=0.02$)	1989–2001; chart review; smoking not clearly defined
Kim et al. 2004	• 342 Stage I-IV NSCLC patients treated with surgery	Current, noncurrent	• 2.32 (1.28–8.97)	1994–1999; chart review

Table 10.7S Continued

Study	Design/population	Proportion of failed implants by smoking status	Estimate of effects (95% CI)	Comments
Nystrom et al. 2009 ^b	<ul style="list-style-type: none"> • Prospective cohort • 38–70 years of age • 26 patients (6 smokers) • 167 implants (36 in smokers) • Follow-up: 11–16 years (mean 13 years) 	<ul style="list-style-type: none"> • Nonsmokers: 14.5% • Smokers: 13.9% 	<ul style="list-style-type: none"> • Crude RR = 0.96 (0.38–2.39)^a 	All patients received maxillary reconstructive surgery, including osteotomy and bone grafts; nonsmokers included 4 former smokers
Torres et al. 2009	<ul style="list-style-type: none"> • Randomized clinical trial • 87 patients (31 smokers) • 282 implants (110 placed in smokers) • Follow-up: 24 months 	<ul style="list-style-type: none"> • Nonsmokers: 1.2% • Smokers: 4.5% 	<ul style="list-style-type: none"> • Crude RR = 3.91 (0.77–19.80)^a 	All patients received anorganic bovine bone, either alone or in combination with platelet-rich plasma, for sinus augmentation prior to implant placement; smoking defined as smoking >10 cigarettes/day
Vandeweghe and De Bruyn 2011	<ul style="list-style-type: none"> • Retrospective cohort • 329 patients (41 smokers) • 712 implants (104 placed in smokers) • Follow-up: 6–28 months 	<ul style="list-style-type: none"> • Nonsmokers: 1.2% • Smokers: 4.8% 	<ul style="list-style-type: none"> • Crude RR = 4.18 (1.35–12.91) 	

Notes: CI = confidence interval; HR = hazard ratio; NAA = not available; NR = not reported; OR = odds ratio; RR = relative risk.

^aCalculation based on reported data.

^bCalculation based on reported data using exact confidence limits.

^cParsimonious multivariate model.

^dProportion of persons with implant failure; unable to calculate proportion of failed implants by smoking status.

^eProportion of patients with implant loss; proportion of implants lost by smoking status was not reported and could not be calculated.

^fConfidence interval was not reported; model included type of restoration and type of implant.

^gConfidence interval was not reported.

^h95% confidence interval was calculated from reported data.

ⁱProportion of patients with implant loss; proportion of implants lost by smoking status was not reported.

^jMantel-Haenszel adjusted for diabetes status.

^kProportion of persons with implant failure; proportion of implants failed was not reported.

Table 10.14S Studies on the association between smoking and rheumatoid arthritis (RA) risk

Study	Design/ population	Tobacco exposure	Outcome	Findings
Heliövaara et al. 1993	• 512 incident RA cases	Never smokers, ex-smokers, current smokers	Diagnosis of RA	• RR of seropositive RA was 2.6 (95% CI, 1.3–5.3) in male ex-smokers and 3.8 (95% CI, 2.0–6.9) in current smokers, in comparison with the men who had never smoked
Voigt et al. 1994	• 349 incident RA cases • 1,457 random controls	Ever, never, pack-years	Diagnosis of RA	• Women with ≥20 pack-years of smoking, RR = 1.5 (95% CI, 1.0–2.0) compared with never smokers
Silman et al. 1996	• 79 monozygotic and 71 same-sex dizygotic twin pairs who were discordant for RA	Never, ever, pack-years	Diagnosis of RA	• Strong association between ever smoking and RA in the monozygotic pairs, OR = 12.0 (95% CI, 1.78–513), with a similar trend observed in the dizygotic pairs, OR = 2.5 (95% CI, 0.92–7.87)
Symmons et al. 1997	• 165 early (<1 year) RA cases • 165 controls	Never, current, past	Diagnosis of RA	• History of having ever smoked was associated with a higher risk of developing RA, OR = 1.66 (95% CI, 0.95–3.06)
Karlson et al. 1999	• 377,481 women	Never, ever, pack-years	Diagnosis of RA, RF status	• In age-adjusted analysis, compared with women who never smoked, the RR of developing RA was 1.01 (95% CI, 0.95–1.08) among past smokers and RR = 1.22 (95% CI, 1.16–1.28) among current smokers
Uhlig et al. 1999	• 361 recently diagnosed RA cases compared to 5,851 random controls	Never, current, past	Diagnosis of RA, RF status	• Current smoking was an overall risk factor, OR = 1.46 (95% CI, 1.10–1.94), in men, OR = 2.38 (95% CI, 1.45–3.92), especially in men with seropositive RA, OR = 4.77 (95% CI, 2.09–10.90)
Criswell et al. 2002	• 31,336 women without history of RA	Never, current, past, pack-years	Diagnosis of RA	• Compared with women who had never smoked, women who were current smokers, RR = 2.0 (95% CI, 1.3–2.9) or who had quit ≤10 years before study baseline, RR = 1.8 (95% CI, 1.1–3.1) were at increased risk of RA, but women who had quit >10 years before baseline were not at increased risk, RR = 0.9 (95% CI, 0.5–2.6)
Padyukov et al. 2004	• 858 RA cases • 1,048 controls	Current, former, nonsmoker	HLA-DRB1 genotyping for SE alleles	• RR of RF-seropositive RA = 2.8 (95% CI, 1.6–4.8) in never smokers with SE genes, RA = 2.4 (95% CI, 1.3–4.6) in current smokers without SE genes, and RA = 7.5 (95% CI, 4.2–13.1) in current smokers with SE genes • Smokers carrying 2 SE genes, RR of RF-seropositive RA = 15.7 (95% CI, 7.2–34.2) • Interaction between smoking and SE genes was significant with AP = 0.4 (95% CI, 0.2–0.7) for smoking and any SE, AP = 0.6 (95% CI, 0.4–0.9) for smoking and 2 SE

Table 10.14S Continued

Study	Design/ population	Tobacco exposure	Outcome	Findings
Costenbader et al. 2006	• 680 women with incident RA and 103,818 women	Never, ever, current, past, pack-years	Diagnosis of RA	<ul style="list-style-type: none"> RR of RA was significantly elevated among current, RR = 1.43 (95% CI, 1.16–1.75) and past smokers, RR = 1.47 (95% CI, 1.231.76), compared with never smokers Risk of RA was significantly elevated with 10 pack-years or more of smoking and increased linearly with increasing pack-years (P trend <.01).
Klareskog et al. 2006	• 930 RA cases • 1,126 controls	Never, ever, pack-years	<i>HLA-DRB1</i> genotyping for <i>SE</i> alleles, anti-ccp antibodies in serum and BAL cells	<ul style="list-style-type: none"> In smokers, increased risk of anti-ccp positive RA in <i>SE</i>-negative individuals, RR = 1.5 (95% CI, 0.8–2.6), 1 <i>SE</i> copy increased RR = 6.5 (95% CI, 3.8–11.4) and 2 <i>SE</i> copies increased RR = 21.0 (95% CI, 11.0–40.2) In nonsmokers, RR was 3.3 (95% CI, 1.8–5.9) with 1 <i>SE</i> copy and 5.4 (95% CI 2.7–10.8) with 2 <i>SE</i> copies
Pedersen et al. 2006	• 515 new (<5 yrs) RA cases • 769 controls	Never, former, current, pack-years	Diagnosis of RA	<ul style="list-style-type: none"> Tobacco smoking, OR = 1.65 (95% CI, 1.03–2.64; for >20 vs. 0 pack-years) was selectively associated with risk of anti-CCP-positive RA
Costenbader et al. 2008	• 437 women with incident RA and age matched, healthy women	Never, ever, pack-years	Diagnosis of RA	<ul style="list-style-type: none"> <i>PTPN22</i> was associated with increased RA risk, pooled OR in multivariable dominant model = 1.46 (95% CI, 1.02–2.08) Significant multiplicative interaction between <i>PTPN22</i> and smoking for more than 10 pack-years was observed (P = 0.04).
Karlson et al. 2010	• 439 RA cases • 439 controls	Never, ever, pack-years	High-resolution <i>HLA-DRB1</i> genotyping for <i>SE</i> alleles	<ul style="list-style-type: none"> Strong additive interaction, AP = 0.50 (p <0.001) and significant multiplicative interaction (p = 0.05) were found between heavy smoking and any <i>HLA-SE</i> in seropositive RA risk Highest risk was in heavy smokers with double copy <i>HLA-SE</i>, OR = 7.47 (95% CI, 2.77–20.11)
Keenan et al. 2010	• 549 RA cases • 549 controls	Ever smoker, Heavy smoker (>10 pack-years)	Genotyping for <i>GSTM1-null</i> and <i>GSTT1-null</i> , and alleles for <i>GSTP1</i> and <i>HMOX1</i>	<ul style="list-style-type: none"> For the risk of all RA, multiplicative (p = 0.05) and additive, AP = 0.53 (P = 0.0005) interactions between the <i>GSTT1-null</i> polymorphism and ever smoking and multiplicative interactions (P = 0.05) between <i>HMOX1</i> and ever smoking were observed
Mikuls et al. 2010	• 605 AA RA cases • 255 AA healthy controls	Current, former, never, pack-years	<i>SE</i> status	<ul style="list-style-type: none"> Significant additive interaction between <i>SE</i> status and heavy smoking (≥ 10 pack-years) in RA risk, AP = 0.58 (p = 0.007) with an AP = 0.47 (p = 0.006) between <i>SE</i> status and ever smoking
Bergström et al. 2011	• 290 incident RA cases	Current smoker, smoker for >10 years, smoker of >20 cigarettes/day	Diagnosis of RA	<ul style="list-style-type: none"> Current smoking associated with RA, OR = 1.79 (95% CI, 1.32–2.42)

Table 10.14S Continued

Study	Design/ population	Tobacco exposure	Outcome	Findings
de Hair et al. 2012	• 55 persons at risk for developing RA followed for average of 13 months	Ever smoker, never smoker	Diagnosis of RA	• Smoking was associated with development of RA, HR = 9.6 (95% CI, 1.3–73.0)
Mikuls et al. 2012	• 727 AA early RA (<2 yrs) cases compared to 262 AA non-RA controls	Current, former, never, heavy smoker ≥ 10 pack-years	Genotyping for drug-metabolizing enzymes, Diagnosis of RA	• Significant additive interactions between heavy smoking and <i>NAT2</i> SNPs <i>rs9987109</i> ($P_{additive} = 0.000003$) and <i>rs1208</i> ($P_{additive} = 0.00001$) • Attributable proportion due to interaction ranged from 0.61–0.67
Nielsen et al. 2012	• 9,712 people without RA	Pack-years	RF status, Development of RA	• High (>100 IU/mL) RF positivity was associated with 10-year risk of developing RA, HR = 39 (95% CI, 18–85), especially if smoker
Too et al. 2012	• 1,076 RA cases and 1,612 matched controls	Ever, never	Genotyping for <i>SE</i> , anti-ccp antibodies, diagnosis of RA	• <i>SE</i> alleles and smoking were associated with increased risk of developing anti-ccp positive RA, OR <i>SE</i> alleles = 4.7 (95% CI, 3.6–6.2) • OR smoking = 4.1 (95% CI, 1.9–9.2)
Bergström et al. 2013	• 172 RA cases compared to age and sex matched controls	Current regular smoker, occasional smoker, former smoker, never smoker	Diagnosis of RA	• Ever smoking increased likelihood of having RA, OR = 2.02 (95% CI, 1.31–3.12)

Note: **AA** = African American; **Anti-ccp** = anticyclic citrullinated peptide; **AP** = attributable proportion; **BAL** = bronchoalveolar lavage; **CI** = confidence interval; **HR** = hazard ratio; **IU/mL** = international units per milliliter; **OR** = odds ratio; **RF** = rheumatoid factor; **RR** = relative risk; **SE** = standard error; **SNPs** = single nucleotide polymorphisms.

Table 10.15S Studies on the association between smoking and rheumatoid arthritis (RA) severity

Study	Population	Tobacco exposure	Outcome	Findings
Saag et al. 1997	• 336 RA patients	Current, former, never, pack-years	Larsen score, RF positivity, and presence of nodules	• Pack-years of cigarette smoking was significantly associated with RF positivity, radiographic erosions, and nodules
Wolfe 2000	• 610 RA patients	Nonsmoker, former, smoker, pack-years	Complete joint examination, health status questionnaires, RF values, Larsen score, nodules	• RF concentration and nodule formation were linearly related to the number of years smoked • Nonlinear relationships were found between smoking and Larsen score and pulmonary illness
Mattey et al. 2002	• 164 women with established RA	Past, current, never, pack-years	HAQ score, Larsen's score	• Ever having smoked was associated with a worse radiographic and functional outcome than was never having smoked • Both past and current smoking were associated with increased disease severity
Turesson et al. 2003	• 609 RA patients	Ever, never	Presence of extra-articular disease	• Main predictor of severe extra-articular manifestations was smoking at RA diagnosis
Papadopoulos et al. 2005	• 293 early RA (<2 years) patients	Current, ex-smokers, nonsmokers	DAS-28, Larsen's score, presence of nodules	• Smoker patients had higher DAS-28, and higher Larsen's score as compared to nonsmokers at diagnosis and at follow-up • Smokers more frequently had rheumatoid nodules than the ex-smokers and nonsmokers
Nyhall-Wahlin et al. 2006	• 112 patients with RA nodules	Current, former, nonsmoker	Presence of nodules	• Strong association between smoking and rheumatoid nodules in early seropositive rheumatoid arthritis
Finckh et al. 2007	• 2,004 RA patients	Nonsmoker, smoker, pack-years	Ratingen score	• Radiographic joint damage progressed at a similar rate in current smokers and nonsmokers • Smoking intensity was associated with a significant inverse dose-response • Heavy smokers (>1 pack-day) progressed significantly less than nonsmokers or moderate smokers
Mikuls et al. 2008	• 300 African American early RA (<2 years) patients	Current, former, never, pack-years	IgA RF serum concentration, nodules	• Current smokers were approximately twice as likely as never smokers to have higher IgA-RF concentrations and nodules
Kim et al. 2008c	• 405 RA patients	Smoker (past or current), nonsmoker	Presence of extra-articular disease	• Smoking was closely associated with extra-articular manifestation
Naranjo et al. 2010	• 7,307 RA patients	Never, former, current	DAS-28, RF, nodules, erosions	• Ever smokers were more likely to be RF-positive • Rheumatoid nodules were more frequent in ever smokers • Erosive arthritis and extra-articular disease were similar in all smoking categories • Mean DAS28 was similar in nonsmokers vs. those who had ever smoked

Table 10.15S Continued

Study	Population	Tobacco exposure	Outcome	Findings
Ruiz-Esquide et al. 2011	• 156 early RA (<2 years) patients	Never, ever, past, current	Disease activity (EULAR), Larsen score,	<ul style="list-style-type: none"> • No difference in disease activity between smokers and nonsmokers • Current smoking associated with radiographic progression of disease
Andersson et al. 2012	• 1,460 early RA (<2 years) patients	Smoker, nonsmoker, pack-years	Disease activity (EULAR response), comorbidities, death	<ul style="list-style-type: none"> • No difference in EULAR responses between smoking groups but high risk of cardiovascular mortality and morbidity in smokers with RA
Moura et al. 2012	• 262 RA patients	Smoker, nonsmoker	Presence of extra-articular disease	<ul style="list-style-type: none"> • Current smoking correlated with presence of extra-articular disease
Söderlin et al. 2013	• 1,421 RA patients	Secondhand smoke	Disease activity (EULAR response)	<ul style="list-style-type: none"> • No association between secondhand exposure and disease activity

Note: **DAS-28** = disease activity scale 28; **EULAR** = European League Against Rheumatism; **HAQ** = health assessment questionnaire; **IgA** = immunoglobulin A; **RF** = rheumatoid factor; **RR** = relative risk; **SE** = standard error.

Table 10.16S Studies on the association between smoking and rheumatoid arthritis (RA) treatment response

Study	Population	Tobacco exposure	Outcome	Findings
Hyrich et al. 2006	• 2,879 patients receiving infliximab or etanercept	Current smoker	EULAR disease response	• Current cigarette smoking was associated with lower response rate among patients receiving infliximab, OR = 0.77 (95% CI, 0.60–0.99)
Inokuma et al. 2008	• 5,043 RA patients on leflunomide	Smoking history	Leflunomide lung injury	• Smoking is a risk factor for developing leflunomide-associated lung injury, OR = 3.12
Westhoff et al. 2008	• 896 early RA patients	Never, quit before RA onset, smoked continuously, pack-years	Drug need	• Current RF+ smokers had taken more DMARD combinations (35.8%) or biologics (14.9%) than RF+ previous smokers (29.9% and 11.2%, respectively) and RF+ never smokers (20.3% and 8.1% respectively), p = 0.022 for DMARDs and p = 0.105 for biologics
Mattey et al. 2009	• 154 RA patients starting anti-TNF drug	Never, past, current, pack-years	EULAR disease response	• Increasing trend of no response with increasing pack-years at 3 and 12 months (p trend = 0.008 and 0.003, respectively) • DAS28 was inversely associated with number of pack-years ($r = -0.28$; p = 0.002)
Abhishek et al. 2010	• 395 RA patients starting their first anti-TNF drug	Current, ex-smoker, nonsmoker	EULAR disease response	• Current smoking reduced the chance of achieving at least a moderate response on the EULAR response criteria when compared with nonsmokers, AOR = 0.20 (95% CI, 0.05–0.83; p = 0.03)
Saevarsdottir et al. 2011	• 535 early RA patients starting MTX and anti-TNF drug	Current, past, never	EULAR disease response	• Compared with never smokers, current smokers were less likely to achieve a good response at 3 months following the start of MTX (27% vs. 36%; P = 0.05) and at 3 months following the start of anti-TNF drugs (29% vs. 43%; p = 0.03)
Canhão et al. 2012	• 617 RA patients starting their first anti-TNF drug	Ever, never	EULAR disease response	• Smoking was negatively associated with good disease response, OR = 0.98 (95% CI, 0.55–1.71; p = 0.009)
Khan et al. 2012	• 150 RA patients receiving rituximab	Current, previous, never	DAS28 score	• Never smokers had the highest falls in DAS28 scores (mean 2.72, SD 0.94) • Previous smokers had fewer falls (mean 1.49, SD 0.92) • Current smokers the least falls (mean 0.63, SD 1.09; p<0.001 by one-way analysis of variance)
Soderlin et al. 2012	• 934 RA patients starting their first anti-TNF drug	Current, previous, never, pack-years	EULAR disease response	• Current smoking was predictive of poor response, OR = 0.53 (95% CI, 0.32–0.87; p = 0.012)

Note: **AOR** = adjusted odds ratio; **CI** = confidence interval; **DAS-28** = disease activity scale 28; **DMARD** = Disease-Modifying Antirheumatic Drug; **EULAR** = European League Against Rheumatism; **MTX** = methotrexate; **OR** = odds ratio; **pack-years** = the number of years of smoking multiplied by the number of packs of cigarettes smoked per day; **RF** = rheumatoid factor; **SD** = standard deviation; **TNF** = tumor necrosis factor.

Table 10.17S Studies on the association between smoking and systemic lupus erythematosus (SLE) risk

Study	Population	Tobacco exposure	Outcome	Findings
Nagata et al. 1995	• 282 female SLE cases • 292 controls	Never, past, current	Diagnosis of SLE	• Risk of SLE was significantly increased for current smokers, age-adjusted OR = 2.31 (95% CI, 1.34–3.97)
Sanchez-Guerrero et al. 1996	• 106,391 women	Never, past, current, pack-years	Diagnosis of SLE	• Age-adjusted RR of SLE showed no relation to smoking status: compared with never smokers, current smokers RR = 1.09 (95% CI, 0.66–1.80) and past smokers RR = 0.91 (95% CI, 0.54–1.55)
Hardy et al. 1998	• 150 SLE cases • 300 controls	Never, ex-smoker, current	Diagnosis of SLE	• Current smokers had a significantly increased risk of development of SLE compared with never smokers, OR = 1.95 (95% CI, 1.14–3.31)
Cooper et al. 2001	• 265 SLE cases • 355 controls	Never, former, current	Diagnosis of SLE	• No association with smoking history and risk of developing SLE, OR = 1.1 (95% CI, 0.7–1.7) for current smokers, or former smokers, OR = 0.6 (95% CI, 0.4–1.0), compared to never smokers
Ghaussy et al. 2001	• 125 SLE cases • 125 controls	Never, ex-smoker, current	Diagnosis of SLE	• Smoking before SLE diagnosis and ex-smoking before SLE diagnosis significantly increased the risk of development of SLE, OR = 6.69 (95% CI, 2.59–17.28; p < 0.001) OR = 3.62 (95% CI, 1.22–10.70; p = 0.02, respectively)
Bengtsson et al. 2002	• 85 SLE cases • 205 controls	Nonsmoker, smoker, pack-years	Diagnosis of SLE	• Suggested association with increased SLE risk was seen for smoking, OR = 1.8 (95% CI, 0.9–3.6)
Formica et al. 2003	• 67 new female SLE cases compared to matched survey participants	Never, past, current, pack-years	Diagnosis of SLE	• IRR for current and past smoking = 1.6 (95% CI, 0.8–3.3) • Risk was greater for women who began smoking before age 19 years, IRR = 1.9 (95% CI, 1.0–3.6)
Miot et al. 2005	• 57 DLE cases • 215 healthy controls	Nonsmokers, smokers	Diagnosis of DLE	• Higher smoking prevalence noted in DLE cases (84.2%) than controls (33.5%), and the adjusted OR was 14.4 (95% CI, 6.2–33.8; multiple logistic regression, p < 0.01)
Cooper et al. 2010	• 258 SLE cases • 263 controls	Never, former, current	Diagnosis of SLE	• Smoking status not associated with SLE risk, OR = 1.2 (95% CI, 0.7–2.3) for former smokers and OR = 0.8, (95% CI, 0.6–1.2) for current smokers, compared to never smokers
Kiyohara et al. 2012a	• 171 female SLE cases • 492 healthy controls	Nonsmokers, former, current	Diagnosis of SLE	• Compared with nonsmoking, current smoking was significantly associated with increased risk of SLE, OR = 3.06 (95% CI, 1.86–5.03)
Kiyohara et al. 2012b	• 151 female SLE cases • 21 female controls	Nonsmokers, former, current	Diagnosis of SLE, genotyping for <i>CYP1A1 rs4646903</i> and <i>GSTM1</i>	• Smokers with <i>CC</i> genotype of <i>CYP1A1 rs4646903</i> were significantly associated with increased risk of SLE, OR = 9.72 (95% CI, 2.73–34.6) • Smokers with combined <i>CYP1A1 rs4646903/GSTM1</i> 'at-risk' genotype were significantly associated with increased risk of SLE, OR = 17.5 (95% CI, 3.20–95.9)

Table 10.17S Continued

Study	Population	Tobacco exposure	Outcome	Findings
Ekbom-Kullberg et al. 2013	<ul style="list-style-type: none"> • 223 SLE cases • 1,538 controls 	Never, ever, past, current, daily, occasional	Diagnosis of SLE	<ul style="list-style-type: none"> • In women with a history of daily smoking for more than 1 year, OR for SLE = 1.45 (95% CI, 1.07–1.97), in current daily smokers as compared to never smokers, OR = 1.55 (1.00–2.40), and in ex-smokers vs. never smokers OR = 1.80 (1.15–2.83) • Number of men with SLE, who smoked >100 cigarettes during their lifetime was higher than in male controls ($p = 0.026$)

Note: **CI** = confidence interval; **DLE** = discoid lupus erythematosus; **IRR** = incidence rate ratio; **OR** = odds ratio; **RR** = relative risk.

Table 10.18S Studies on the association between smoking and systemic lupus erythematosus (SLE) severity and manifestations

Study	Population	Tobacco exposure	Outcome	Findings
Ward and Studenski 1992	• 160 adults with SLE nephritis	Nonsmoker, former, current	Development of ESRD	<ul style="list-style-type: none"> Smoking status at onset of nephritis was strongly associated with differences in time to development of ESRD with a median time of developing ESRD at 146 months for smokers and 273 months for nonsmokers
Ghaussey et al. 2003	• 111 SLE cases	Never, ex-smoker, current	SLEDAI	<ul style="list-style-type: none"> Current smokers demonstrated significantly higher SLEDAI scores than ex-smokers and never smokers
Calvo-Alén et al. 2005	• 570 SLE cases	Never, ever	Presence of thrombotic event	<ul style="list-style-type: none"> Smoking is a significant risk factor for thrombosis
Freemer et al. 2006	• 410 SLE cases	Never, former, current	Serum dsDNA antibodies	<ul style="list-style-type: none"> Significantly higher risk of dsDNA seropositivity in current smokers than former or never smokers
Kaiser et al. 2009	• 1930 SLE cases	Never, ever	Presence of thrombotic event	<ul style="list-style-type: none"> Smoking was a significant risk factor for thrombosis
Turchin et al. 2009	• 276 SLE cases	Never, past, current	Cumulative cutaneous damage scores	<ul style="list-style-type: none"> Current smoking is associated with scarring and active lupus rash
Barta et al. 2010	• 181 women with SLE	Never, past, current	Health related quality of life	<ul style="list-style-type: none"> Smokers more likely to have poor health related quality of life compared to nonsmokers
Piette et al. 2012	• 218 CLE or SLE cases	Never, past, current	Disease severity, response to treatment, quality of life	<ul style="list-style-type: none"> Current smokers with SLE had worse disease and worse quality of life than nonsmokers
Bourré-Tessier et al. 2013	• 1,346 SLE cases	Never, ever, past, current, pack-years	SLEDAI-2K, cutaneous ACR criteria	<ul style="list-style-type: none"> Current smoking was associated with active rash, as recorded by the SLEDAI-2K, OR = 1.63 (95% CI, 1.07–2.48) for current vs. noncurrent smokers, and OR = 1.68 (95% CI, 1.08–2.60) for current vs. never smokers Ever smoking was associated with the presence of cutaneous ACR criteria, OR = 1.50 (95% CI, 1.22–1.85) Association driven by discoid rash, OR = 2.36 (95% CI, 1.69–3.29) and photosensitivity, OR = 1.47 (95% CI, 1.11–1.95) Higher pack-years was associated with the presence of active rash among current smokers, RR/5 pack-years = 1.17 (95% CI, 1.06–1.29).

Note: **ACR** = American College of Radiology; **CI** = confidence interval; **CLE** = cutaneous lupus erythematosus; **dsDNA** = double-stranded DNA; **ESRD** = end stage renal disease; **pack-years** = the number of years of smoking multiplied by the number of packs of cigarettes smoked per day; **OR** = odds ratio; **RR** = relative risk; **SLEDAI** = systemic lupus erythematosus disease activity index.

Table 10.19S Studies on smoking and systemic lupus erythematosus (SLE) treatment response

Study	Population	Tobacco Exposure	Outcome	Findings
Wahie et al. 2011	• 200 cases with DLE (11 with SLE) on hydroxychloroquine	Nonsmoker, smoker	Clinical response to hydroxychloroquine	• No significant difference in response rate between nonsmokers compared with smokers (OR = 0.78; 95% CI: 0.43–1.45; p = 0.27)
Jewell and McCauliffe 2000	• 61 cases (47 DLE, 14 SCLE)	Nonsmoker, ex-smoker, smoker, pack-years	Skin disease response to therapy	• A significant difference ($p < .0002$) in antimalarial response rate was observed for smokers (40%) vs. nonsmokers (90%)

Note: **CI** = confidence interval; **CLE** = cutaneous lupus erythematosus; **DLE** = discoid lupus erythematosus; **ESRD** = end stage renal disease; **OR** = odds ratio; **pack-years** = the number of years of smoking multiplied by the number of packs of cigarettes smoked per day; **SCLE** = subacute cutaneous lupus erythematosus.

Table 10.20S Characteristics of the studies on the effects of current smoking on Crohn's disease or ulcerative colitis

Study	Design/Population	Current smoking definition	Number of cases analyzed in current smoking comparison	Type of effect estimate^a	Findings/ Effect estimates (95% CI)	Adjustments for current smoking effect estimate
Mayberry et al. 1978	• Case control • Prevalent Crohn's disease • United Kingdom	Current at questionnaire	100 cases	OR	• Current smoking: 1.08 (0.62–1.89)	
Harries et al. 1982	• Case control • Prevalent Crohn's disease • United Kingdom	Current at questionnaire	101 cases	OR	• Current smoking: 1.15 (0.71–1.89)	
Thornton et al. 1985	• Case control • Prevalent Crohn's disease • 28 cases • United Kingdom	Current at symptom onset	28 cases	OR	• Current smoking: 5.70 (1.81–17.97)	
Franceschi et al. 1987	• Case control • Prevalent Crohn's disease • 109 cases • Italy	Current at time of diagnosis		OR	• Current smoking: 4.20 (2.30–7.70)	Age, gender, education or social class, former smoking, body mass index, other
